Nodal staging is an integral part of determining therapy and prognosis in most primary tumors and the evaluation of lymph nodes involves accurate anatomical localization followed by characterization. While there is an abundance of surgical literature highlighting the distribution of regional lymph nodes in various primary tumors, a comprehensive imaging text highlighting the anatomical nodal stations and their involvement in various primary tumors is lacking. The current atlas attempts to highlight nodal anatomy by way of color illustrations and color-coded topographical depiction on cross-sectional imaging studies. We hope the content will be useful and informative to a wide range of readers filling in the void about nodal anatomy.
