# Contents

1 The Origins of Modern Physics .............................................................. 1
   1.1 Special Relativity ................................................................. 1
   1.2 Quantum Mechanics ............................................................. 3
      1.2.1 Axioms of Quantum Mechanics ..................................... 8
      1.2.2 Quantum Information ................................................. 9
   1.3 Quantum Statistical Mechanics .............................................. 13
      1.3.1 Microcanonical Ensemble ......................................... 13
      1.3.2 Canonical Ensemble ................................................... 14
      1.3.3 Grand Canonical Ensemble ....................................... 15
   1.4 Solved Problems ................................................................. 17

2 Second Quantization of Light .............................................................. 21
   2.1 Electromagnetic Waves ....................................................... 21
      2.1.1 Photons ................................................................. 23
      2.1.2 Electromagnetic Potentials and Coulomb Gauge ............... 24
   2.2 Second Quantization of Light .............................................. 27
      2.2.1 Fock versus Coherent States for the Light Field ............. 30
      2.2.2 Linear and Angular Momentum of the Radiation Field ...... 33
      2.2.3 Zero-Point Energy and the Casimir Effect ....................... 34
   2.3 Quantum Radiation Field at Finite Temperature ....................... 36
   2.4 Phase Operators ............................................................... 38
   2.5 Solved Problems ............................................................... 40

3 Electromagnetic Transitions .............................................................. 51
   3.1 Classical Electrodynamics ................................................... 51
   3.2 Quantum Electrodynamics in the Dipole Approximation ............... 53
      3.2.1 Spontaneous Emission .............................................. 55
      3.2.2 Absorption ............................................................. 58
      3.2.3 Stimulated Emission .................................................. 59
3.3 Selection Rules ........................................ 60
3.4 Einstein Coefficients .................................... 62
  3.4.1 Rate Equations for Two-Level and Three-Level Systems ........................................ 64
3.5 Life-Time and Natural Line-Width .......................... 66
  3.5.1 Collisional Broadening ................................ 67
  3.5.2 Doppler Broadening .................................... 68
3.6 Minimal Coupling and Center of Mass ........................ 69
3.7 Solved Problems ....................................... 70

4 The Spin of the Electron .................................... 81
4.1 The Dirac Equation .................................... 81
4.2 The Pauli Equation and the Spin .......................... 85
4.3 Dirac Equation with a Central Potential ..................... 87
  4.3.1 Relativistic Hydrogen Atom and Fine Splitting .......... 88
  4.3.2 Relativistic Corrections to the Schrödinger Hamiltonian ........................................ 89
4.4 Solved Problems ....................................... 91

5 Energy Splitting and Shift Due to External Fields ............ 99
5.1 Stark Effect ........................................... 99
5.2 Zeeman Effect ........................................... 101
  5.2.1 Strong-Field Zeeman Effect ............................ 102
  5.2.2 Weak-Field Zeeman Effect .............................. 104
5.3 Solved Problems ....................................... 106

6 Many-Body Systems ....................................... 115
6.1 Identical Quantum Particles ................................ 115
6.2 Non-interacting Identical Particles ......................... 117
  6.2.1 Uniform Gas of Non-interacting Fermions ............. 119
  6.2.2 Atomic Shell Structure and the Periodic Table of the Elements ........................................ 121
6.3 Interacting Identical Particles ............................. 123
  6.3.1 Variational Principle .................................... 124
  6.3.2 Hartree for Bosons ...................................... 125
  6.3.3 Hartree-Fock for Fermions .............................. 126
  6.3.4 Mean-Field Approximation .............................. 129
6.4 Density Functional Theory ................................ 131
6.5 Molecules and the Born-Oppenheimer Approximation .......... 138
6.6 Solved Problems ....................................... 140

7 Second Quantization of Matter ................................ 145
7.1 Schrödinger Field ....................................... 145
7.2 Second Quantization of the Schrödinger Field ................ 147
  7.2.1 Bosonic and Fermionic Matter Field ..................... 150
Quantum Physics of Light and Matter
Photons, Atoms, and Strongly Correlated Systems
Salasnich, L.
2017, XI, 244 p. 9 illus., Hardcover
ISBN: 978-3-319-52997-4
