Contents

1 On the “Complex” Interplay Between Mathematics and Living Systems ........................................ 1
  1.1 Introduction ................................................................ 1
  1.2 A Quest Through Three Scientific Contributions .......... 3
  1.3 Five Key Questions .................................................. 5
  1.4 Complexity Features of Living Systems ....................... 5
  1.5 Rationale Toward Modeling and Plan of the Book .......... 11

2 A Brief Introduction to the Mathematical Kinetic Theory of Classical Particles .................................... 15
  2.1 Plan of the Chapter .................................................. 15
  2.2 Phenomenological Derivation of the Boltzmann Equation .... 16
    2.2.1 Interaction dynamics ....................................... 19
    2.2.2 The Boltzmann equation ................................... 20
    2.2.3 Properties of the Boltzmann equation ................... 23
  2.3 Some Generalized Models ......................................... 25
    2.3.1 The BGK model ............................................ 26
    2.3.2 The discrete Boltzmann equation ....................... 26
    2.3.3 Vlasov and Enskog equations ............................ 28
  2.4 Computational Methods ......................................... 30
  2.5 Critical Analysis .................................................. 31

3 On the Search for a Structure: Toward a Mathematical Theory to Model Living Systems ......................... 33
  3.1 Plan of the Chapter ................................................ 33
  3.2 A Representation of Large Living Systems .................. 35
  3.3 Mathematical Structures for Systems with Space Homogeneity .... 39
    3.3.1 A phenomenological description of games ............ 39
    3.3.2 Modeling interactions by tools of game theory ....... 42
    3.3.3 Mathematical structures for closed systems .......... 44
3.3.4 Mathematical structures for open systems .......................... 46
3.3.5 Sources of nonlinearity .............................................. 48

3.4 Mathematical Structures for the Dynamics in a Network .......... 50
3.4.1 Structures for discrete activity variables ........................ 54

3.5 Structures when Space is a Continuous Variable .............. 55
3.5.1 Representation ...................................................... 56
3.5.2 Modeling interactions .............................................. 58
3.5.3 Preliminary rationale toward modeling interactions ........... 59
3.5.4 Mathematical structures ............................................ 64
3.5.5 Mean field models .................................................. 68
3.5.6 Perturbation of space homogeneity ............................... 69

3.6 Critical Analysis ....................................................... 70

4 From the Mathematical Theory to Applications ...................... 75
4.1 Plan of the Chapter ..................................................... 75
4.2 Selection of the Case Studies ......................................... 77
4.3 From Mathematical Structures to the Derivation of Models ...... 78
4.4 Additional Rationale on the Validation of Models ............... 79
4.5 Critical Analysis ....................................................... 82

5 Modeling Social Behavioral Dynamics ............................... 85
5.1 Plan of the Chapter ..................................................... 85
5.2 On the Contribution of Mathematics to Social Sciences ........ 86
5.2.1 From bounded rationality to behavioral social dynamics ........ 86
5.2.2 Mathematical tools toward modeling social dynamics .......... 88
5.3 On the Search of a Mathematical Structure ....................... 90
5.3.1 Heuristic description and representation of social systems .... 90
5.3.2 Mathematical structures ............................................ 92
5.3.3 Some reasonings toward modeling interactions ............... 95
5.3.4 An overview of models and their conceptual basis .......... 97
5.4 Hallmarks of a Systems Theory of Social Systems ............... 98
5.4.1 Ability to capture complexity features .......................... 98
5.4.2 Towards a systems approach ...................................... 99
5.4.3 Reasonings on a case study ..................................... 100
5.4.4 Simulations and parameters sensitivity analysis ............. 104
5.5 Open Problems and Research Perspectives ......................... 111
5.5.1 Perspectives in modeling social dynamics ..................... 112
5.5.2 Modeling multicellular systems and immune competition ........ 113
5.5.3 Revisiting population dynamics .................................. 116
5.5.4 Analytic problems ................................................. 117
6 Mathematical Models of Crowd Dynamics in Complex Venues............. 119
   6.1 Plan of the Chapter........................................ 119
   6.2 Overview on Crowd Modeling................................ 120
       6.2.1 Features of Behavioral Crowds.................... 121
       6.2.2 Scaling, Representation, and Mathematical Structures... 122
   6.3 On the Kinetic Theory Approach to Behavioral Dynamics............. 125
       6.3.1 Mesoscopic Representation of a Crowd............... 126
       6.3.2 A Mathematical Structure............................ 127
   6.4 Mathematical Models....................................... 129
       6.4.1 Modeling Crowds in Bounded and Unbounded Domains........ 130
       6.4.2 Modeling Panic Conditions........................... 133
   6.5 Crowd Dynamics Simulations.................................. 135
       6.5.1 Consistency with the Velocity Diagrams.............. 136
       6.5.2 Self-organized Lane Formation....................... 138
   6.6 On the Dynamics of Multicellular Systems.......................... 142
       6.6.1 From Kinetic Theory to a Macroscopic Model......... 144
       6.6.2 A Numerical Test and Critical Analysis............. 150
   6.7 Open Problems and Research Perspectives.......................... 154
       6.7.1 Social Dynamics in Human Crowds.................... 154
       6.7.2 Modeling Vehicular Traffic........................... 155
       6.7.3 Some Reasonings on the Modeling of Swarm Dynamics........ 156
       6.7.4 Analytic and Computational Problems.................. 159

7 On the Search for a Mathematical Theory of Living Systems............. 161
   7.1 Plan of the Chapter........................................ 161
   7.2 On the Conceptual Distance between Soft and Hard Sciences........ 162
   7.3 Multiscale Issues Toward a Mathematical Theory................... 164
   7.4 Waiting for a Mathematical Theory of Living Systems............. 166

References......................................................... 169
