3.3.2 The maximum possible number of triangulations ........................................ 112
3.3.3 The minimum possible number of triangulations ........................................ 115
3.3.4 The poset of subdivisions ................................................................. 116
3.4 Flips in triangulations ........................................................................... 119
3.4.1 All triangulations of a point set in the plane are connected by flips .......... 120
3.4.2 Effective enumeration of triangulations .............................................. 123
3.4.3 Further properties of the graph of flips .............................................. 128
3.5 Pseudo-triangulations .......................................................................... 131
3.6 Life in three dimensions ....................................................................... 133
3.6.1 The number of tetrahedra .................................................................. 134
3.6.2 Monotone flipping does not (always) work ....................................... 137
3.6.3 The number of flips ......................................................................... 141
3.7 Notes and References .......................................................................... 145
Exercises .................................................................................................. 146

4 A Tool Box ............................................................................................. 149
4.1 Combinatorics of configurations .......................................................... 149
4.1.1 Dependences, circuits, and the intersection property ....................... 150
4.1.2 Evaluations, cocircuits, and the union property .................................. 155
4.1.3 Gale transforms and the duality between circuits and cocircuits .......... 160
4.2 Manipulating vector configurations ....................................................... 165
4.2.1 Pyramids and joins ......................................................................... 165
4.2.2 Prisms and products ...................................................................... 167
4.2.3 Deletion .......................................................................................... 169
4.2.4 Contraction ..................................................................................... 171
4.2.5 One-point suspension .................................................................... 175
4.3 Generating polyhedral subdivisions ..................................................... 178
4.3.1 The placing (or pushing) triangulation ........................................... 178
4.3.2 The pulling triangulation ................................................................ 181
4.3.3 Lexicographic triangulations ........................................................... 182
4.3.4 Pushing and pulling refinements ..................................................... 183
4.4 Two equivalent characterizations of flips .............................................. 185
4.4.1 Flips via circuits ........................................................................... 186
4.4.2 Flips via walls ............................................................................... 188
4.5 More characterizations of triangulations and subdivisions ...................... 190
4.5.1 Geometric characterizations ............................................................ 191
4.5.2 Combinatorial characterizations ...................................................... 203
Exercises .................................................................................................. 207

5 Regular Triangulations and Secondary Polytopes .................................... 209
5.1 The secondary polytope ....................................................................... 210
5.1.1 Motivating examples ...................................................................... 210
5.1.2 Statement of the main theorem ....................................................... 214
5.1.3 Dimension and affine span of the secondary polytope ....................... 217
5.2 The normal fan of the secondary polytope ......................................... 221
5.2.1 Secondary cones ........................................................................... 221
5.2.2 The secondary fan ......................................................................... 225
5.2.3 Proof of the main theorem ............................................................. 229

7.3.3 Exponential number of components in the graph of flips ........................................ 361

7.4 Dimension 6: A disconnected graph of triangulations in general position .................. 362
7.4.1 The building block: Gale octagons ............................................................................. 363
7.4.2 Seventeen points in special position ......................................................................... 365
7.4.3 A disconnected space of triangulations in general position ................................... 369

Exercises ......................................................................................................................... 374

8 Algorithmic Issues ........................................................................................................ 377
8.1 Tools for computation ................................................................................................. 377
8.1.1 Chirotopes .............................................................................................................. 377
8.1.2 Computing the chirotope ....................................................................................... 378
8.1.3 Computing circuit and cocircuit signatures from the chirotope ............................... 383
8.2 Verification and realizability ....................................................................................... 385
8.2.1 Constructing regular triangulations in practice ................................................... 386
8.2.2 Checking regularity of a triangulation .................................................................... 387
8.3 Listing and enumerating triangulations ..................................................................... 388
8.3.1 Exploring a flip-graph component ......................................................................... 389
8.3.2 Enumeration of all triangulations ........................................................................... 390
8.3.3 Enumeration with symmetry .................................................................................. 392
8.3.4 Implementation issues ........................................................................................... 393
8.4 Bounding the number of triangulations ..................................................................... 396
8.5 Optimization ................................................................................................................. 398
8.5.1 A linear optimization approach: the universal polytope ....................................... 400
8.5.2 Relaxations of the universal polytope and its edges ............................................ 406
8.5.3 Equidecomposable and weakly neighborly polytopes .......................................... 410
8.6 Computational complexity of triangulation problems ................................................. 413
8.6.1 A very quick review of complexity classes ......................................................... 413
8.6.2 The hardness of the planar constrained triangulation problem ............................. 415
8.6.3 Hardness of minimum length triangulations in the plane .................................... 422
8.6.4 Hardness of minimal size triangulations of convex polytopes .............................. 425

Exercises ......................................................................................................................... 429

9 Further Topics ............................................................................................................... 433
9.1 Fiber polytopes ........................................................................................................... 433
9.1.1 Monotone paths ...................................................................................................... 433
9.1.2 Zonotopal tilings .................................................................................................... 436
9.1.3 Polyhedral subdivisions ......................................................................................... 438
9.1.4 Compatible subdivisions and the fiber polytope ................................................... 438
9.2 Mixed subdivisions and the Cayley trick .................................................................. 445
9.2.1 An example ............................................................................................................ 445
9.2.2 Mixed subdivisions and the Minkowski projection ............................................. 447
9.2.3 Subdivisions in the Cayley embedding and the Cayley projection ..................... 452
9.2.4 The Cayley trick .................................................................................................... 454
9.2.5 Product of a triangle and k-simplex ...................................................................... 459
9.3 Lattice polytopes and unimodular triangulations ....................................................... 463
9.3.1 Triangulations of lattice polygons ......................................................................... 465
9.3.2 Existence of unimodular triangulations ................................................................ 469
9.3.3 Ehrhart polynomials and unimodular triangulations ......................................... 475
9.4 Triangulations and Gröbner bases ........................................ 478
  9.4.1 Gröbner bases and toric ideals .................................... 479
  9.4.2 Sturmfels’ correspondence ......................................... 481
9.5 Polytopal complexes and regular triangulations .......................... 488
  9.5.1 Central and normal fans as regular triangulations .................. 489
  9.5.2 Shellings, flips, and face vectors .................................. 493
  9.5.3 Polytopality via regular triangulations ............................... 502

Exercises  .............................................................................. 509
