## Contents

1 Introduction ............................................................... 1  
Further Reading ............................................................. 2

2 Postulates of Thermodynamics ........................................ 3  
2.1 Thermodynamic Systems: Postulate 1 ............................ 4  
   2.1.1 Constrained Systems and the Measurability of Energy via Mechanical Work ................................................. 6  
2.2 The Conditions of Equilibrium: Postulates 2, 3 and 4 .......... 8  
   2.2.1 Properties of the Entropy Function .......................... 10  
   2.2.2 Properties of the Differential Fundamental Equation ...... 13  
   2.2.3 The Scale of Entropy and Temperature ...................... 15  
   2.2.4 Euler Relation, Gibbs–Duhem Equation and Equations of State .............................................................. 17  
   2.2.5 The Fundamental Equation of an Ideal Gas .................... 18  
   2.2.6 The Fundamental Equation of an Ideal van der Waals Fluid ................................................................. 22  
Further Reading ............................................................. 28

3 Thermodynamic Equilibrium in Isolated and Isentropic Systems .... 29  
3.1 Thermal Equilibrium .................................................. 32  
3.2 Thermal and Mechanical Equilibrium ............................... 36  
3.3 Thermal and Chemical Equilibrium .................................. 37  
Further Reading ............................................................. 41

4 Thermodynamic Equilibrium in Systems with Other Constraints .... 43  
4.1 Equilibrium in Constant Pressure Systems: The Enthalpy Function ................................................................. 44  
4.2 Equilibrium in Constant Temperature and Constant Volume Systems: The Free Energy Function .......................... 46
# Phase Equilibria

7 Phase Equilibria .......................................................... 125

7.1 Stability of Phases ...................................................... 127

7.2 Phase Equilibria of Pure Substances ................................. 129

7.2.1 Phase Diagrams of Pure Substances ............................. 135

7.2.2 Calculation of the Quantity of Coexisting phases:
    the Lever Rule ...................................................... 139

7.2.3 Calculation of Equilibrium Temperature and Pressure;
    the Clausius–Clapeyron Equation ................................. 141

7.2.4 First-Order and Second-Order Phase Transitions ............... 144

7.3 Liquid–Vapor Equilibrium of Ideal Binary Mixtures ............... 147

7.4 Liquid–Vapor Equilibrium of Real Binary Mixtures ............... 154

7.5 Solid–Liquid Equilibrium of Ideal Binary Mixtures .............. 158

7.6 Equilibrium of Partially Miscible Binary Mixtures ............... 159

7.6.1 Liquid–Liquid Phase Diagrams .................................. 161

7.6.2 Solid–Liquid Phase Diagrams .................................... 163

7.6.3 Colligative Properties: Equilibrium of a Binary Mixture
    Phase and a Pure Phase Containing One of the Mixture
    Components .................................................................. 178

7.7 Phase Diagrams of Multicomponent Systems ....................... 185

7.8 Separation of Components Based on Different Phase Diagrams ... 190

Further Reading ............................................................. 200

# Equilibria of Chemical Reactions

8 Equilibria of Chemical Reactions ....................................... 201

8.1 Condition of a Chemical Equilibrium at Constant Temperature
    and Pressure ............................................................ 202

8.1.1 Relation of the Equilibrium Constant and the
    Stoichiometric Equation ............................................ 205

8.1.2 Affinity: The Driving Force of Chemical Reactions ........... 206

8.2 The Equilibrium Constant in Terms of Different Activities ...... 211

8.2.1 Heterogeneous Reaction Equilibria
    of Immiscible Components ......................................... 214

8.3 Calculation of the Equilibrium Constant from
    Thermodynamic Data ................................................ 218

8.4 Temperature and Pressure Dependence of the Equilibrium
    Constant ........................................................................ 221

8.4.1 The Le Châtelier–Braun Principle ................................ 223

Further Reading ............................................................. 226

# Extension of Thermodynamics for Additional Interactions

9 Extension of Thermodynamics for Additional Interactions
    (Non-Simple Systems) ................................................. 227

9.1 Thermodynamics of Interfaces: Two-Dimensional
    Equations of State ..................................................... 231

9.1.1 Thermodynamic Properties of Curved Surfaces ................ 234
9.2 Thermodynamic Description of Systems Containing Electrically Charged Particles ...................................... 241
  9.2.1 Thermodynamic Consequences of the Electroneutrality Principle: The Chemical Potential of Electrolytes and the Mean Activity Coefficient ......................... 244
  9.2.2 Chemical Potential of Ions in an Electric Field: The Electrochemical Potential ......................... 251
  9.2.3 Heterogeneous Electrochemical Equilibria: The Galvanic Cell ............................................. 253
  9.2.4 Electrodes and Electrode Potentials ......................... 259
Further Reading ........................................................................................................ 264

10 Elements of Equilibrium Statistical Thermodynamics .............. 265
  10.1 The Microcanonical Ensemble ........................................ 266
  10.1.1 Statistical Thermodynamics of the Einstein Solid in Microcanonical Representation ..................... 269
  10.1.2 Statistical Thermodynamics of a System of Two-State Molecules in Microcanonical Representation ................................................................. 272
  10.2 The Canonical Ensemble ............................................. 274
  10.2.1 Calculation of the Canonical Partition Function from Molecular Data ......................................... 280
  10.2.2 Statistical Thermodynamics of the Einstein Solid and the System of Two-State Molecules in Canonical Representation ............................................. 281
  10.2.3 The Translational Partition Function. Statistical Thermodynamics of a Monatomic Ideal Gas ......................... 283
  10.2.4 Calculation of the Rotational, Vibrational, and Electronic Partition Functions ............................. 287
  10.2.5 Statistical Characterization of the Canonical Energy ........ 291
  10.2.6 The Equipartition Theorem .......................................... 294
  10.3 General Statistical Definition and Interpretation of Entropy ...................................................... 297
  10.4 Calculation of the Chemical Equilibrium Constant from Canonical Partition Functions ......................... 300
Further Reading ........................................................................................................ 306

11 Toward Equilibrium: Elements of Transport Phenomena ............ 307
  11.1 Transport Equations for Heat, Electricity, and Momentum ...... 309
  11.2 Equations for the Diffusive Material Transport ..................... 311
  11.2.1 Fick’s First Law: The Flux of Diffusion ................................. 312
  11.2.2 Fick’s Second Law: The Rate of Change of the Concentration Profile ......................................... 312
  11.3 Principle Transport Processes and Coupled Processes ................................................................. 316
Further Reading ........................................................................................................ 318
Appendix

A1 Useful Relations of Multivariate Calculus

A.1.1 Differentiation of Multivariate Functions
A.1.2 Differentiation of Composite Functions
A.1.3 Differentiation of Implicit Functions
A.1.4 Integration of Multivariate Functions
A.1.5 The Euler Equation for Homogeneous First-Order Functions

A2 Changing Extensive Variables to Intensive Ones:
Legendre Transformation
A.2.1 Legendre Transformations
A.2.2 Legendre Transformation of the Entropy Function

A3 Classical Thermodynamics: The Laws
A.3.1 Zeroth Law and Temperature
A.3.2 First Law and Energy
A.3.3 Second Law and Entropy
A.3.4 Third Law and the Uniqueness of the Entropy Scale
