Argumentation in Science Education

Perspectives from Classroom-Based Research

Series: Contemporary Trends and Issues in Science Education, Vol. 35

- **The first book on argumentation in science education**
- **Brings together leading international experts in the field of argumentation in science education from around the world**
- **Includes both theoretical and empirical perspectives**

This book brings together the work of leading experts in argumentation in science education. It presents research combining theoretical and empirical perspectives relevant for secondary science classrooms. Since the 1990s, argumentation studies have increased at a rapid pace, from stray papers to a wealth of research exploring ever more sophisticated issues.

This volume constitutes a unique collection and covers fundamental issues in argumentation such as cognitive, methodological and epistemological aspects; classroom-based research in teaching and learning of argumentation in science classrooms; and argumentation in context such as in socio-scientific and moral contexts. The book's underlying premise is that argumentation is a significant aspect of scientific inquiry and plays an important role in teaching and learning of science. Argumentation also contributes to the agenda of informed citizenship where students are encouraged and supported in evidence-based reasoning in their everyday lives.

"Argumentation appeared as a major theme in science education research during the mid-1990s. Since that time, researchers working on themes such as the nature of science in science education, science education for citizenship, and language in the science classroom have all addressed argumentation in their work. This book brings together key lines of work and key scholars, presenting a state-of-the-art review of argumentation in science education."
