- Publishes research and reviews of mechanisms by which drugs affect behavior
- Extends from clinical psychopharmacology to studies of effects of drugs on human cognition and behavior
- Covers methodologies from neurochemical assays to functional neuroimaging studies

Psychopharmacology is an international journal that covers the broad topic of elucidating mechanisms by which drugs affect behavior. The scope of the journal encompasses the following fields:

**Human Psychopharmacology: Experimental**

This section includes manuscripts describing the effects of drugs on mood, behavior, cognition and physiology in humans. The journal encourages submissions that involve brain imaging, genetics, neuroendocrinology, and developmental topics. Usually manuscripts in this section describe studies conducted under controlled conditions, but occasionally descriptive or observational studies are also considered.

**Human Psychopharmacology: Clinical and Translational**

This section comprises studies addressing the broad intersection of drugs and psychiatric illness. This includes not only clinical trials and studies of drug usage and metabolism, drug surveillance, and pharmacoepidemiology, but also work utilizing the entire range of clinically relevant methodologies, including neuroimaging, pharmacogenetics, cognitive science, biomarkers, and others. Work directed toward the translation of preclinical to clinical knowledge is especially encouraged. The key feature of submissions to this section is that they involve a focus on clinical aspects.

**Preclinical psychopharmacology: Behavioral and Neural**

This section considers reports on the effects of compounds with defined chemical structures on any aspect of behavior, in particular when correlated with neurochemical effects, in species other than humans.

Impact Factor: 3.308 (2016), Journal Citation Reports®
