

Progress in Inflammation Research

Series Editors: M.J. Parnham, A. Schmidtke

The last few years have seen a revolution in our understanding of how blood and tissue cells interact and of the intracellular mechanisms controlling their activation. This has not only provided multiple targets for potential anti-inflammatory and immunomodulatory therapy, but has also revealed the underlying inflammatory pathology of many diseases.

This monograph series provides up-to-date information on the latest developments in the pathology, mechanisms and therapy of inflammatory disease. Areas covered include: vascular responses, skin inflammation, pain, neuroinflammation, arthritis cartilage and bone, airways inflammation and asthma, allergy, cytokines and inflammatory mediators, cell signalling, and recent advances in drug therapy.

Each volume is edited by acknowledged experts providing succinct overviews on specific topics intended to inform and explain. The series is of interest to academic and industrial biomedical researchers, drug development personnel and rheumatologists, allergists, pathologists, dermatologists and other clinicians requiring regular scientific updates.
