# Contents

**Foreword** by Dan Kopans .............................................. vii  
**Preface** ................................................................. ix  

1 **Fundamentals of Magnetic Resonance Imaging** ................. 1  
  Subatomic Particles ................................................. 3  
  The Atom .............................................................. 4  
  Magnetic Dipole Moments ......................................... 6  
  Nuclear Magnetic Moments ...................................... 9  
  Tissue Magnetization ............................................... 10  
  Magnetic Fields .................................................... 13  
  Precession and Magnetic Resonance ............................. 14  
  Tissue Excitation .................................................. 14  
  Measuring the Magnetic Resonance Signal ..................... 15  
  The Basic Nuclear Magnetic Resonance Experiment .......... 16  
  Chapter Take-home Points ....................................... 16  
  References .......................................................... 17  

2 **Tissue Relaxation** ................................................ 19  
  Nuclear Magnetic Resonance ..................................... 19  
  T1 Relaxation ........................................................ 21  
  T2 Relaxation ........................................................ 23  
  Distinguishing T2 and T2* ....................................... 25  
  The Physical Basis of Relaxation Times ....................... 28  
  Chapter Take-home Points ....................................... 29  
  References .......................................................... 29  

3 **Spatial Resolution in Magnetic Resonance Imaging** .......... 31  
  Basic Components of a Magnetic Resonance Imaging System .... 31  
  Magnets .............................................................. 31  
  Radiofrequency Transmitter Coils ............................... 33
4 The Spin-echo Pulse Sequence ........................................... 47
Spin-echo Pulse Sequence Diagram .............................. 47
Signal Dependence on TR and TE in Spin-echo Imaging .......... 51
Contrast in Spin-echo Imaging .......................................... 53
Acquisition Times in Spin-echo Imaging ......................... 56
Multi-slice Imaging .................................................... 56
Chapter Take-home Points ............................................. 58
References ................................................................. 58

5 Gradient Echo Sequences and 3D Imaging .............. 59
The Gradient-echo Pulse Sequence Diagram .................. 60
Variants of Gradient-echo Imaging ................................. 63
Signal Dependence on TR, TE, and θ in Spoiled
Gradient-echo Imaging ................................................ 64
Contrast in Spoiled Gradient-echo Pulse Sequences .......... 66
Steady-state Gradient-echo Imaging ............................... 67
Total Acquisition Time in 2D Gradient-echo Imaging ........ 68
3D Gradient-echo Imaging ............................................. 69
Chapter Take-home Points ............................................. 72
References ................................................................. 73
Suggested Reading ........................................................ 73

6 Fast-spin Echo, Echo Planar, Inversion Recovery,
and Short-T1 Inversion Recovery Imaging .................. 75
Fast Spin-echo Imaging ................................................ 75
Echo-planar Imaging ................................................... 80
Inversion Recovery and Short-T1 Inversion Recovery Imaging .... 83
Real and Magnitude Reconstructions of IR Spin-echo Signal ... 86
Short T1 Inversion Recovery Imaging ............................ 87
Chapter Take-home Points ............................................. 89
References ................................................................. 91
7 Signal, Noise, Signal-to-Noise, and Contrast-to-Noise Ratios .......................... 93

Magnetic Resonance Signal ................................................................. 93
Noise in a Magnetic Resonance Image .................................................. 94
System Parameters Affecting Noise ....................................................... 99
  Volume of the Radiofrequency Receiver Coil ...................................... 99
  Receiver Bandwidth .............................................................................. 99
Signal-to-Noise Ratios ............................................................................ 100
  Effect of Magnetic Field Strength on Signal-to-Noise Ratios ................. 101
Effect of User-selectable Image Acquisition Parameters on Signal-to-Noise Ratios ................................................................. 102
  Effects of TR, TE, and Flip Angle on Signal-to-Noise Ratios ................. 102
  Effect of Spatial Parameters on Signal-to-Noise Ratios ........................ 102
  Effect of Slice Thickness on Signal-to-Noise Ratios ............................. 103
  Effect of the Number of Frequency-encoding Steps ............................. 104
  Effect of the Number of Phase-encoding Steps .................................... 105
Putting Together All Factors Affecting Signal-to-Noise Ratios ................. 105
  Signal-to-Noise Ratios in 2D (Planar) Imaging .................................... 106
  Signal-to-Noise Ratios in 3D (Volume) Imaging ................................... 107
Contrast and Contrast-to-Noise Ratios ................................................... 107
The Rose Model ...................................................................................... 108
Effect of Image Addition on Signal, Noise, Signal-to-Noise Ratios and Contrast-to-Noise Ratios ................................................................. 109
Effect of Image Subtraction on Signal, Noise, Signal-to-Noise Ratios and Contrast-to-Noise Ratios ................................................................. 110
Chapter Take-home Points ..................................................................... 111
References ............................................................................................. 111

8 Contrast Agents in Breast Magnetic Resonance Imaging ....................... 113

A Brief History of Contrast Media in the Breast .................................... 113
Gadolinium-based Contrast Agents ......................................................... 113
The Physiologic Basis of Contrast Enhancement .................................... 118
Dosage of Gadolinium-chelated Contrast Agents .................................... 120
Safety of Gadolinium-chelated Contrast Agents ..................................... 120
  Possible Adverse Events Resulting from Gadolinium-chelates .............. 121
  Nephrogenic Systemic Fibrosis: A New Adverse Event of Gadolinium-chelates ................................................................. 122
Sensitivity and Specificity of Contrast-enhanced Breast ......................... 123
Magnetic Resonance Imaging ................................................................. 123
Timing of Pulse Sequences After Contrast Injection ............................... 125
Temporal Resolution in Contrast-enhanced Breast ................................... 126
Magnetic Resonance Imaging ................................................................. 126
Trade-offs Between Adequate Temporal Resolution and Adequate Spatial Resolution ................................................................. 129
Obtaining High Temporal Resolution and High Spatial Resolution
Contrast-enhanced Studies .................................................. 130
Enhancement of Normal Fibroglandular Tissues
in Pre-menopausal Women .................................................. 130
Chapter Take-home Points .................................................. 131
References ........................................................................... 132
Suggested Reading ................................................................. 134

9 Breast Magnetic Resonance Imaging Acquisition Protocols ....... 135

Essential Elements of an Image Acquisition Protocol ................. 135
Pre-contrast T1-weighted Non-fat-saturated Pulse Sequence .......... 136
Pre-contrast T2-weighted Sequences ....................................... 137
Contrast-enhanced Sequences ................................................. 139
Magnetic Field Strength of at Least 1.5 T and High Magnetic
Field Homogeneity ............................................................... 142
Bilateral Imaging with Prone Positioning .................................. 142
3D Gradient-echo T1-weighted Pulse Sequences
for Contrast-enhanced Imaging .............................................. 144
Good Fat Suppression over Both Breasts in Contrast-enhanced
Breast Magnetic Resonance Imaging ....................................... 145
Adequately Thin Image Slices ................................................ 145
Pixel Sizes of Less than 1 mm in Each in-plane Direction ............ 146
Proper Selection of the Phase-encoding Direction to Minimize
Artifacts Across the Breasts .................................................. 147
A Total 3D Fourier Transform Acquisition Time
for Both Breasts of Less than 2 Minutes ................................. 149
Meeting Temporal and Spatial Resolution Requirements
in 3D Gradient-echo Imaging ............................................... 150
Time-saving Measures in 3D Gradient-echo Imaging .................. 151
Optimizing Contrast-enhanced Studies .................................... 161
Examples of Contrast-enhanced Scanning Protocols Meeting
Temporal and Spatial Requirements ...................................... 162
Examples of Deficient Contrast-enhanced Protocols ................... 163
Chapter Take-home Points .................................................... 168
References ........................................................................... 168

10 Image Post-processing Protocols ........................................ 171

Automated or Prescribed Post-processing Techniques ............... 171
Image Subtraction and Re-registration .................................... 172
Maximum Intensity Projections of Subtracted Data .................... 174
Multiplanar Image Reconstruction .......................................... 177
Creation of Enhancement Maps Based on Multiple
Time Point Acquisitions ....................................................... 179
