INTRODUCTION XXI

How This Book Is Organized XXII

PART ONE: GAS, BUGS, AND COMMON SENSE 1

Chapter 1: The Fog of War 3

GAS AND BUGS 5

CBW, Briefly Defined 6

THE UTILITY OF CBW AGENTS 7

Making the Enemy "Suit Up" 7

Leaving a Large Footprint 8

Implying a Threat 9

ACQUISITION 9

Obtaining CW Precursors 10

The Development of BW Programs 10

Dual-Use Technologies in BW 12

Production 12

CW Agent Production 12

BW Agent Production 13

WEAPONIZATION 14

CW Weapon Design 14

Weaponizing BW Agents 16
Chapter 2: Who Has These Weapons?

THE SUPERPOWER AND FORMER SUPERPOWER

The United States
  Chemical Weapons
  CW in World War II
  CW During the Cold War
  Current Status of US Chemical Weapons
  Biological Weapons
  The Post-World War II Era and the Korean War

Russia and the Former Soviet Union
  Chemical Weapons
  The Russian Federation in the 1990s
  Biological Weapons

THE MIDDLE EAST

Iraq
  Chemical Weapons
  The Gulf War (1990–1991)
  Iraqi VX
  Biological Weapons

Iran
  Chemical Weapons
  Biological Weapons

Syria
  Chemical Weapons
  Biological Weapons

Egypt
  Chemical Weapons
  Biological Weapons

Libya
  Chemical Weapons
  Operation at Tarhunah
  Biological Weapons

Israel
  Chemical Weapons
Biological Weapons

EAST ASIA
North Korea
Chemical Weapons
Suspected CW Arsenal
Biological Weapons
South Korea
China (PRC)
Chemical Weapons
Biological Weapons
Taiwan

OTHER PLAYERS
South Africa
Chemical Weapons
Biological Weapons
Cuba

SUB-STATE ACTORS

Chapter 3: Threats and Responses

Chapter 3: Threats and Responses

A NEW KIND OF WARFARE
The First World Trade Center Bombing
Aum Shinrikyo
Taking the Toll

MEDICAL THREATS AND RESPONSES
Anthrax
The Disease
Anthrax as a Weapon
Treatment and Vaccination
Smallpox
The Disease
Smallpox as a Weapon
Vaccination

CIVIL DEFENSE THREATS AND RESPONSES
The Chemical Industry
Bhopal
Densely Populated Spaces
Water Supplies
Crop Dusters
PART TWO: CHEMICAL AGENTS

Chapter 4: Basic Concepts

WHAT CHEMICAL WEAPONS ARE NOT

WHAT CHEMICAL WEAPONS ARE

BASIC CLASSES OF CW AGENTS

Choking Gases (Lung Irritants)

Chlorine
Phosgene
Diphosgene
Chloropicrin (or Chlorpicrin)
Ethylidichlorarsine
Perfluorobutylhexane (PRB)

Blister Agents (Vesicants)

Mustard (Sulfur)
Nitrogen Mustard
Lewisite
Phosgene Oxime ("Nettle Gas")
Phenyldichlorarsine (PD)

Blood Agents

Hydrogen Cyanide: Instrument of the Shoah
Cyanogen Chloride
Arsine (Arsemiuretted Hydrogen)
Carbon Monoxide
Hydrogen Sulfide ("Sour Gas")

Nerve Agents (Toxic Organophosphates)

Nerve Agent Proliferation
Dynamics of Nerve Agent Poisoning

Incapacitants: Psychoactive Chemicals in War

Belladonna, or Glycolate Alkaloids
3-Quinuclidinyl Benzilate (BZ)
Ergot and Lysergic Acid Diethylamide (LSD)
### Chapter 5: Chemical Warfare: A Brief History

**FROM GREEK FIRE TO THE FLAMMENWERFER**

- The Nineteenth Century
- The Dawn of Organic Chemistry
- From the Flammenwerfer to the Livens Projector:
  - The Buildup to War
    - The Livens Projector
    - Chemistry That Changed the World

**WORLD WAR I**

- The Chlorine Attack at Ypres
- Mustard Enters the War
- Weapons Used and Abandoned

**THE AFTERMATH: PERSPECTIVES ON CHEMICAL WARFARE**

- Tukhachevsky and the War Against the Peasants
- The Wushe (Paran) Incident:
- The First Use of Chemical Weapons in Asia?
- Ethiopia: 1935–1936

**WORLD WAR II**

- The Sino-Japanese War
- United States and CW Policy
- Churchill and Chemical Weapons
- The Bari Incident

**FROM KOREA TO THE GULF WAR**

- Allegations of Chemical Warfare in Korea
- Southeast Asia: 1965–1975

# PART THREE: BIOLOGICAL AGENTS

## Chapter 7: Basic Concepts

### BIOLOGICAL WARFARE AGENTS

### THE NATURE OF INFECTIOUS DISEASE

- The Germ Theory of Disease
- The Advent of Modern Microbiology
- The Airborne Origin of Infectious Disease

### DIFFERENTIATING AMONG PATHOGENS

- Bacteria
- The Rickettsiae
- Viruses
- Bioaerosols

### BIOLOGICAL WARFARE AGENTS

#### Bacteria
- Anthrax
- Plague
- Tularemia
- Glanders
- Q-Fever
- Cholera

#### Viruses
- Smallpox
- Hemorrhagic Fever Viruses
- Venezuelan Equine Encephalitis (VEE)
- Foot-and-Mouth Disease

#### Biological Toxins
- Mycotoxins
- Fungi (Molds)
- Botulinum Toxin
- Staphylococcal Enterotoxin Type B (SEB)
- Ricin and Saxitoxin
- Trichothecene Mycotoxins (T2)
# Chapter 10: Vaccination and Biological Warfare

### DISEASE AS DETERRENCE

- Smallpox, Variolation, and the First Vaccines
  - *Jenner’s Vaccinia*
  - Typhus and DDT

### MODERN MILITARY VACCINATIONS

- Typhoid and the Boer War (1899–1902)
- Yellow Fever as a BW Threat
- Japanese B Encephalitis and the War in the Pacific
- Botulinum and D-Day
- Plague and the Vietnam War (1965–1975)
- Botulinum Toxoid and the Gulf War (1991)
- Vaccinating for Anthrax in the Twenty-First Century
  - *Historical Development*
  - *The Current Controversy*

### NOTES

- 267

### SELECT BIBLIOGRAPHY

- 293

### INDEX

- 295
As these lines are being written, firemen, police officers, and a host of other rescue workers are still trying to save victims of the terrorist attacks on the World Trade Center and the Pentagon. Even without precise counts of the dead and wounded in Pennsylvania, Virginia, and New York, we can already conclude that this attack was a signal event of mass destruction, with the outcome certain to make it the deadliest single terrorist act ever committed against United States citizens. The number who died in the attacks and the 100-minute aftermath will almost certainly exceed the number of American armed forces killed at Pearl Harbor, or on D-Day. But these victims of terror were, by and large, civilians, people going about their business. And the instruments of their death, the murder weapons, were not, until yesterday, considered weapons at all.

It is always hard, but especially under these circumstances, to talk about weaponry, the tools of war and terror. What can these new weapons be compared to? How can they be described? The US Department of Defense categorizes the most deadly kinds of armaments as “weapons of mass destruction,” or WMDs, and defines them as “capable of a high order of destruction . . . of being used in such a manner as to destroy large numbers of people.”* This does not tell us much. How does one define “a high order of destruction” and “large numbers of people”? Timothy McVeigh, who was responsible for bombing the Alfred P. Murrah Federal Building in Oklahoma City in 1995, was indicted on US federal charges for using a WMD, a truckload of improvised explosives. In the blast, 168 people were killed—again overwhelmingly civilians, men, women, and children going about their business.

Was McVeigh charged with using a WMD because 168 is a large enough number? Is this or a number near it the dividing line between an ordinary act of savagery and one in which we call the killers’ implements weapons of mass destruction?

destruction? Chemical and biological armaments have the potential to kill huge numbers of people, many times the number killed by McVeigh’s bomb. And certainly it seems to make sense that the US Department of Defense categorizes them as WMDs. But is it not true that almost any weapon, even the machetes used in Rwanda in 1994, can be used to perpetrate horrors on an unspeakable scale?

The term “weapons of mass destruction”—probably coined in 1956 by the Soviet Red Army Marshal Georgi Konstantinovich Zhukov (known as “the hero of Stalingrad”)—has, like any defining or categorizing word, its shortcomings. It explains some things, but goes only so far. The arms expert Ken Alibek, whom we shall meet later in this book, suggests that a better name for biological armaments might be “mass casualty weapons,” since their object is to inflict human injury but not to destroy buildings or property. Distinctions like these are grim—but they are also useful. They help us refine and sharpen our sense of things. They help us face up to and describe in words what otherwise may be overwhelming, confusing, frightening. And of course trying to face up to facts and describe events—no matter how horrible they may be—is the first step toward understanding.

My wish is that readers will take up this book in that spirit. Studying weaponry and warfare and disarmament isn’t just a challenging and stimulating intellectual discipline for its own sake. The stakes are much too high for that. Its aim instead is to help us understand a long-standing aspect of human behavior, a force in human history, that seems capable of devising new tools of destruction that we may have to face at times and in places where we least expect them—in a pair of towers above a great harbor, in offices at the heart of our vast and powerful military establishment, and in a quiet country field in southwestern Pennsylvania.

Acknowledgments

The Monterey Institute, Center for Nonproliferation Studies, would like to thank the Ploughshares Fund for their generous support of this project. Any views expressed herein are solely those of the author, and not necessarily those of the Ploughshares Fund or the Monterey Institute.

I would personally like to thank the following people, all of whom were instrumental in making this book happen. First, I want to thank Jonathan B. Tucker, the director of the Chemical and Biological Weapons Nonproliferation Program at the Monterey Institute, who initiated this project and Clarisa-Perez Armendariz and John Hart who made strategic contributions towards the development of the text. I also wish to thank other colleagues at the Monterey Institute who were always there for me when I needed assistance or scholarly advice: Jason Pate, Diana McCauley, Gavin Cameron, Kathleen Vogel, Gary Ackerman, Kimberly McCloud, Raymond Zilinskas, Amy Sands, Tim McCarthy, Mari Sudo, Dan Pinkston, Amin Tarzi, Michael Barletta, Gaurav Kampani, Sonia Ben Ouagrham, Fred Wehling, Yuan Jing-Dong, Evan Medeiros, Lisa Burns, Phillip Saunders and Clay Moltz. Dr. Anthony T. Tu has been most helpful, and I am privileged to have his friendship as well as expertise. Martin Hugh-Jones has been most patient with my inane questions from time to time. My good friends and scholars at the National Chengchi University in Taiwan, Yuan I and Arthur S. Ding have taught me a great deal about East Asian proliferation issues, and Jean-Pascal Zanders has been a wealth of wisdom and a dear friend. Thanks also go to my colleagues and Monterey Institute of International Studies graduates Ken Palnau, Anisha Lal, Anjali Bhattacharjee, Matt Osbourne, Tim Ballard, Faith Stackhouse, Garvey McIntosh, and Jason Evans for their invaluable support in developing the book. My dear friend Al J. Venter has made important contributions to my thinking about a number of issues discussed here. Special thanks go to the excellent editorial staff at Copernicus Books for really making it all happen and to Michael Hennelly for his invaluable advice. Our appreciation goes to Pernacca Sudhakaran, Ewen Buchanan, and the excellent staff at the UN photo laboratory for their dedication and generous use of photographs. There are many others who would prefer to remain anonymous, but I want to thank them as well.

A big thank you to my family for their love and support.

Any errors, committed or otherwise, are solely my responsibility.
Introduction

Why study chemical and biological warfare (CBW)? At the very lowest level, the topic lends itself to morbid curiosity. The scale on which “bugs and gas” can be used to kill people, and the way in which they cause death, can make for gruesome reading. Then there is the matter that these weapons are considered, rightly or wrongly, to be abominable, and those who wish to confirm that opinion will find in studying CBW plenty to abhor. Readers in these two categories are likely to be disappointed by what they will find in this book.

Fear is another motive for study. One can hardly read the paper or listen to the news today and not, sooner rather than later, hear reports about the bellicose nations, repressive regimes, and terrorist organizations that have access to, or are working on the development of, these weapons. The mere existence of CBW armaments, we are told, poses a significant threat to the stability of international order. Even if one believes that the nuclear standoff between superpowers—the Balance of Terror that characterized the Cold War—is a thing of the past, we now have a whole new cast of characters to worry about. They are less well understood than our old adversary the Soviet Union, and less predictable. They operate as states (or sometimes “rogue states”), but also in the shadows, in league with networks of terrorists, global criminal enterprises, and splinter groups representing every conceivable type of fanaticism. And they will, it is almost certain, push us into a whole new kind of decades-long war. For readers arriving with this point of view, I hope this book will serve as a kind of corrective.

It is not my belief that CBW armaments are benign, or that states and substate organizations are not wishing for or even planning chemical or biological attacks against the United States and the rest of the industrialized world. I am not someone who places great faith in the good will and sober judgment of, say, Saddam Hussein. In fact, if I were a betting man, I would put my money on the likelihood that we will see chemical or biological weapons attacks in the not-too-distant future. But where this book perhaps differs from some more popular discussions of the topic is in its argument, in its underlying theme, that biological and especially chemical attacks of any magnitude are extremely difficult to plan, develop, execute, and fund. Certainly it is true that a fanatical cult...
could release nerve agent on a crowded subway car, as happened in Tokyo in
March 1995. And the ultimate splinter group, a single deranged individual, may
be perfectly capable of killing, injuring, or incapacitating large numbers of
individuals in any number of ways chemical or biological. If you add to these
all the belligerent major powers, rogue states, and oppressive regimes world-
wide (and factor in their client terrorist organizations as well), you can imag-
ine no end of mischief—gas attacks, reservoir poisonings, anthrax outbreaks,
and so forth. But what we have to do is dwell less on nightmare scenarios and
try to learn—as calmly and clearly as possible—what CBW agents are, how
they work, who has used them in the past, and what is being done to limit their
proliferation. Fear may be a good motivator, but it is not, as far as I can tell, an
aid to understanding.

How This Book Is Organized
This book is divided into three major parts. In Part I, “Gas, Bugs, and Common
Sense,” there is a brief introduction to and definition of CBW (Chapter 1),
including descriptions of why and how nation-states and “sub-states” (for
example, terrorist organizations) develop chemical and biological weapons.
Chapter 2 then lists, in a fairly straightforward manner, the nations that have
CBW capabilities, along with brief descriptions of the particular agents they
possess. In Chapter 3, we take a look at some of the threats we’re likely and
unlikely to face.

Part II is focused on chemical weapons. In Chapter 4, there are rather exten-
sive descriptions and discussions of more than fifty of the best-known CW
agents. Chapter 5 is a history of chemical warfare from ancient times to the
present. And Chapter 6 discusses in detail the workings of the 1992 Chemical
Weapons Convention (CWC), by all accounts one of the most effective inter-
national treaties written. (But not, as the chapter makes clear, without its limi-
tations.) Included in the chapter is a lengthy discussion of the extremely
difficult matter of verification, and the highs and lows of the international
community’s relationship with Iraq, an unwilling signer of the accord.

Part III, which more or less mirrors Part II, focuses on biological agents and
weapons, with Chapter 7 describing more than forty biological agents in
detail. Chapter 8 focuses on BW armaments in history, again covering a broad
span. Chapter 9 covers the Biological Weapons and Toxins Convention of 1972
(BWTC), a work of the best intentions but not much good effect. (The suc-
cess of the CWC and the comparative ineffectiveness of the BWTC are dis-
cussed in some detail.) Finally, a whole chapter (Chapter 10) is devoted to the
issue of vaccinations and biological warfare.
