Preface to the Second Edition	vii
Preface to the First Edition	xi

I PROVABILITY

I	Introduction to Formal Languages	3
1	General Information	3
2	First-Order Languages	5
	Digression: Names	9
3	Beginners' Course in Translation	9
	Digression: Syntax	15
II	Truth and Deducibility	19
1	Unique Reading Lemma	19
2	Interpretation: Truth, Definability	23
3	Syntactic Properties of Truth	28
	Digression: Natural Logic	33
4	Deducibility	36
	Digression: Proof	45
5	Tautologies and Boolean Algebras	49
	Digression: Kennings	53
6	Godel's Completeness Theorem	55
7	Countable Models and Skolem's Paradox	61
8	Language Extensions	66
9	Undefinability of Truth: The Language <i>SELF</i>	69
10	Smullyan's Language of Arithmetic	71
11	Undefinability of Truth: Tarski's Theorem	74
	Digression: Self-Reference	77
12	Quantum Logic	78
	Appendix: The Von Neumann Universe	89
	The Last Digression. Truth as Value and Duty: Lessons of Mathematics	96
III	The Continuum Problem and Forcing	105
1	The Problem: Results, Ideas	105
2	A Language of Real Analysis	110
3	The Continuum Hypothesis Is Not Deducible in L_2 Real	114

4	Boolean-Valued Universes	120
5	The Axiom of Extensionality Is “True”	124
6	The Axioms of Pairing, Union, Power Set, and Regularity Are “True”	127
7	The Axioms of Infinity, Replacement, and Choice Are “True”	132
8	The Continuum Hypothesis Is “False” for Suitable B	140
9	Forcing	145
IV	The Continuum Problem and Constructible Sets	151
1	Gödel’s Constructible Universe	151
2	Definability and Absoluteness	155
3	The Constructible Universe as a Model for Set Theory	158
4	The Generalized Continuum Hypothesis Is L -True	161
5	Constructibility Formula	164
6	Remarks on Formalization	171
7	What Is the Cardinality of the Continuum?	172
<hr/>		
II	COMPUTABILITY	
<hr/>		
V	Recursive Functions and Church’s Thesis	179
1	Introduction. Intuitive Computability	179
2	Partial Recursive Functions	183
3	Basic Examples of Recursiveness	187
4	Enumerable and Decidable Sets	191
5	Elements of Recursive Geometry	201
VI	Diophantine Sets and Algorithmic Undecidability	207
1	The Basic Result	207
2	Plan of Proof	209
3	Enumerable Sets Are D -Sets	211
4	The Reduction	214
5	Construction of a Special Diophantine Set	217
6	The Graph of the Exponential Is Diophantine	221
7	The Factorial and Binomial Coefficient Graphs Are Diophantine	221
8	Versal Families	223
9	Kolmogorov Complexity	226
<hr/>		
III	PROVABILITY AND COMPUTABILITY	
<hr/>		
VII	Gödel’s Incompleteness Theorem	235
1	Arithmetic of Syntax	235
2	Incompleteness Principles	240
3	Nonenumerability of True Formulas	241

4	Syntactic Analysis	243
5	Enumerability of Deducible Formulas	249
6	The Arithmetical Hierarchy	252
7	Productivity of Arithmetical Truth	255
8	On the Length of Proofs	258
VIII Recursive Groups		263
1	Basic Result and Its Corollaries	263
2	Free Products and HNN-Extensions	266
3	Embeddings in Groups with Two Generators	270
4	Benign Subgroups	271
5	Bounded Systems of Generators	275
6	End of the Proof	280
IX Constructive Universe and Computation		285
1	Introduction: A Categorical View of Computation	285
2	Expanding Constructive Universe: Generalities	289
3	Expanding Constructive Universe: Morphisms	293
4	Operads and PROPs	296
5	The World of Graphs as a Topological Language	298
6	Models of Computation and Complexity	307
7	Basics of Quantum Computation I: Quantum Entanglement	315
8	Selected Quantum Subroutines	319
9	Shor's Factoring Algorithm	322
10	Kolmogorov Complexity and Growth of Recursive Functions	325
<hr/>		
IV MODEL THEORY		
<hr/>		
X	Model Theory	331
1	Languages and Structures	331
2	The Compactness Theorem	334
3	Basic Methods and Constructions	342
4	Completeness and Quantifier Elimination in Some Theories	350
5	Classification Theory	359
6	Geometric Stability Theory	364
7	Other Languages and Nonelementary Model Theory	374
Suggestions for Further Reading		379
