1 Introduction to the Problems of Relaxation and Diffusion in Complex Systems .......................... 1
   1.1 Historical Perspective ............................................ 1
   1.2 Relaxation and Diffusion ........................................ 12
      1.2.1 Macroscopic Description of Dynamics: Time- and Frequency-Dependent Mechanical Properties 14
      1.2.1.1 Shear Creep and Recovery ............................... 14
      1.2.1.2 Shear Stress Relaxation ................................. 15
      1.2.1.3 Dynamic Shear Modulus ................................. 16
      1.2.1.4 Dynamic Shear Compliance ............................. 17
      1.2.1.5 Tensile (Bulk, Longitudinal) Compliance and Tensile (Bulk, Longitudinal) Modulus 19
      1.2.2 Macroscopic Description of Dynamics: Time- and Frequency-Dependent Dielectric Properties 20
      1.2.2.1 Dielectric Permittivity .................................. 20
      1.2.2.2 Electric Modulus ......................................... 21
      1.2.3 Macroscopic Description: Spectroscopy Based on Other Variables ................................. 22
      1.2.3.1 Heat Capacity Spectroscopy ............................ 22
      1.2.3.2 Spectroscopy Based on Other Macroscopic Dynamic Variables 23
   1.3 Molecular Description of Dynamics in the Linear Response Regime ............................... 24
      1.3.1 Dielectric Relaxation ...................................... 29
      1.3.2 Light Scattering ............................................ 33
      1.3.3 Nuclear Magnetic Resonance ............................... 34
      1.3.4 Neutron Scattering ...................................... 35
      1.3.5 The Green–Kubo Relation Between Transport Coefficients and Time Correlation Functions 37
      1.3.6 The Fluctuation–Dissipation Theorem ..................... 39
   1.4 Obstacles of Progress in Finding a Solution ........................................... 40
1.4.1 An Unsolved Many-Body Problem ............................................. 40
1.4.2 Plethora of Experimental Facts: Anomalies are the Real Guides to Solution ......................................................... 41
1.4.3 An Interdisciplinary Research Area: Downside and Upside 44
  1.4.3.1 The Downside ................................................................. 44
  1.4.3.2 The Upside ................................................................. 45
1.5 Universal (Anomalous) Properties: The Outstanding Guides to Solution of the Problem .............................................. 46

2 Glass-Forming Substances and Systems ........................................... 49
  2.1 Current Status of the Glass Transition Problem ......................... 49
  2.2 General Properties and Anomalies ............................................ 50
    2.2.1 Non-exponential Time Correlation Function of the Structural $\alpha$-Relaxation, $\exp[-(t/\tau_\alpha)^{1-n}]$, the Kohlrausch Stretched Exponential Function .................. 52
      2.2.1.1 Crossover of Correlation Function from $\exp(-t/\tau_0)$ to $\exp[-(t/\tau)^{1-n}]$ at $t_c$, a Temperature-Insensitive Time .................. 63
      2.2.1.2 Crossover of Temperature Dependence of Viscosity at High Temperatures ......................................................... 70
      2.2.1.3 A Relation Between Primitive Relaxation Time and Many-Body Relaxation Time Resulting from the Crossover at $t_c$ (the Coupling Model) .................. 73
  2.2.2 Length Scale and Dynamic Heterogeneous Nature of the Structural Relaxation ......................................................... 88
    2.2.2.1 Length Scale from the Free Volume Model ....................... 88
    2.2.2.2 Length Scale from the Configuration Entropy Model .............. 88
    2.2.2.3 Length Scale from the Thermodynamic Fluctuation Theory .................. 95
    2.2.2.4 Dynamic Heterogeneity and Its Length Scale ...................... 96
    2.2.2.5 Length Scale from Relaxation Behavior of Nanophase-Separated Side-Chain Polymers ........ 108
    2.2.2.6 Length Scale from Nanoconfinement .................................. 112
    2.2.2.7 Length Scale from Multi-point Dynamical Susceptibilities ............... 118
    2.2.2.8 Length Scale Is Not Practical to Use as Measure of Many-Body Dynamics .................. 123
    2.2.2.9 Why Fixation on the Length Scale of the $\alpha$-Relaxation, and Disregard of the Width of the Dispersion? .................. 125
  2.2.3 $T_g$-Scaled Temperature Dependence of $\eta$ or $\tau_\alpha$ and the Steepness or “Fragility” Index ........................................... 127
2.2.3.1 The $T_g$-Scaled Plot of $\eta$ by Oldekop–Laughlin–Uhlmann–Angell .......................... 127
2.2.3.2 The Steepness or “Fragility” Index ........................................ 129
2.2.3.3 Isobaric Fragility $m_P$ Decreases with Increasing Pressure .................... 132
2.2.3.4 The Isochoric “Fragility” $m_V$ Is Significantly Less Than the Isobaric “Fragility” $m_P$ .................................................. 132
2.2.3.5 Correlation Between Kinetic “Fragility” and Thermodynamic “Fragility”? ........ 133
2.2.3.6 Correlation of Kinetic “Fragility” with Other Quantities? ........................ 140
2.2.3.7 Different Patterns of Change of $m$ with the Molecular Weight $M$ of Polymers .... 141
2.2.3.8 Breakdown of Correlation Between $m$ and $n$ .............................. 141
2.2.3.9 Restoration of Correlation Between $m$ and $n$ When Restricted to the Same Family . 144
2.2.3.10 Colloidal Suspension of Soft Spherical Particles: Proving Non-exponentiality $(n)$ and Fragility $(m)$ Are Parallel Consequences of Inter-particle Interaction .................. 146

2.2.4 Invariance of the $\alpha$-Dispersion to Various Combinations of $T$ and $P$ While Keeping $\tau_\alpha$ Constant ........ 150
2.2.4.1 Molecular Glassformers .................................................. 152
2.2.4.2 Amorphous Polymers .................................................. 157
2.2.4.3 Ionic Liquids .......................................................... 161
2.2.4.4 Pharmaceutical and Saccharides ....................................... 162
2.2.4.5 Invariance of the $\alpha$-Dispersion to Different $T$ and $P$ Combinations at Constant $\tau_\alpha$ Investigated by Other Techniques than Dielectric Spectroscopy ........ 164
2.2.4.6 The $\alpha$-Dispersion of a Component in Binary Polymer Blends Is Invariant to $T$ and $P$ When $\tau_\alpha$ Is Constant .................. 165
2.2.4.7 The $\alpha$-Dispersion of a Component in Mixtures of Two Small Molecular Glassformers Is Invariant to $T$ and $P$ When $\tau_\alpha$ Is Constant .......................... 166
2.2.4.8 Impact on Theory by $T$–$P$ Superpositioning of the $\alpha$-Dispersion at Constant $\tau_\alpha$ .......................... 168

2.2.5 Other Structural Relaxation Properties Either Governed by or Correlated with the Dispersion of the $\alpha$-Relaxation ........................................ 170
2.2.5.1 Failure of a Single Vogel–Fulcher–
Tamman–Hesse (VFTH) Expression
to Describe the Temperature
Dependence of $\tau_\alpha(T)$ ..................................... 171
2.2.5.2 The $Q^{-2/(1-n)}$-Dependence of $\tau_\alpha$ ............. 193
2.2.5.3 Non-linear Enthalpy Relaxation of
Glassformers Near and Below $T_g$ ...................... 195
2.2.5.4 Correlation Between $n$ and Aging Time ........... 201
2.2.5.5 The Effect of Shear on the Non-
equilibrium Structural Dynamics of an
Aging Colloidal Suspension of Laponite .......... 205
2.2.5.6 Breakdown of the
Stokes–Einstein Equation
and the Debye–Stokes–Einstein
Relation .................................................. 206
2.2.5.7 Changes Effected by Mixing with
Another Glassformer ................................. 232
2.2.5.8 Decrease of Relaxation Time by
Nanoconfinement ...................................... 247
2.2.5.9 Breakdown of Thermorheological
Simplicity of Relaxation Mechanisms
of Different Time/Length Scales, and
Viscoelastic Anomalies of Polymer:
Degree Depends on $n$ ................................. 251
2.2.5.10 Non-linear Deformation of Amorphous
Polymers .............................................. 267
2.3 A Fundamentally Important Class of Secondary Relaxations ... 272
2.3.1 Background .......................................... 272
2.3.2 The Important Class of Secondary Relaxations That
Are Well Connected to the Primary $\alpha$-Relaxation:
The Johari–Goldstein $\beta$-Relaxations .................... 277
2.3.2.1 Correlation Between the Ratio $\tau_\alpha/\tau_{\text{JG}}$
and $n$ at a Predetermined Value of $\tau_\alpha$ .......... 278
2.3.2.2 Good Correspondence Between $\tau_{\text{JG}}$ and
the Primitive Relaxation Time $\tau_0$ at
Ambient Pressure ..................................... 285
2.3.2.3 Excess Loss over the Kohlrausch Fit of
the $\alpha$-Relaxation, or the Excess Wing .......... 301
2.3.2.4 Excess Wing (Unresolved JG
$\beta$-Relaxation) Eclipsed by the $\gamma$-Relaxation ... 306
2.3.2.5 Encroachment of the JG $\beta$-Relaxation
Toward the $\gamma$-Relaxation: The Cause
of the Purported Observation of
Anomalous $T$-Dependence of $\tau_\gamma$ ............... 312
2.3.2.6 Removing the Confusion Caused by the Interpretation of the Excess Wing (EW) of Others .......................................................... 318
2.3.2.7 Digression on NCL .................................................. 324
2.3.2.8 $\tau_{\text{JG}}$ Like $\tau_a$ Is Pressure Dependent, and Co-invariance of $n$ and $\tau_a/\tau_{\text{JG}}$ at Constant $\tau_a$ .................................................. 327
2.3.2.9 From Causality: Dependence of $\tau_a$ on $T$, $P$, $V$, and $S$ Originates from That of $\tau_0$ (or $\tau_{\text{JG}}$) ........................................ 345
2.3.2.10 Systematic Increase of the Ratio $\tau_a/\tau_{\text{JG}}$ (or $\tau_a/\tau_0$) of a Glassformer A (by Increase of $n$) on Mixing with Increasing Concentration of a Less Mobile Glassformer B ........................................ 345
2.3.2.11 Increase of the Ratio $\tau_a/\tau_{\text{JG}}$ (or $\tau_a/\tau_0$) on Polymerizing or Cross-Linking a Glassformer (by Increase of $n$) ............ 358
2.3.2.12 Systematic Decrease of the Ratio $\tau_a/\tau_{\text{JG}}$ (or $\tau_a/\tau_0$) of a Glassformer A (by Decrease of $n$) on Mixing with Increasing Concentration of a More Mobile Glassformer B ........................................ 359
2.3.2.13 Systematic Increase of the Ratio $\tau_a/\tau_{\text{JG}}$ (or $\tau_a/\tau_0$) on Increasing the Molecular Weight of Polymers, Constancy of $\tau_{\text{JG}}$ or $\tau_0$ ........................................ 362
2.3.2.14 Changing the Ratio $\tau_a/\tau_{\text{JG}}$ (or $\tau_a/\tau_0$) by Change in Tacticity of Polymers, Constancy of $\tau_{\text{JG}}$ or $\tau_0$ ........................................ 363
2.3.2.15 Change of $T$-Dependence of $\tau_{\text{JG}}$ on Crossing $T_g$ ........................................ 364
2.3.2.16 Doubt on the Universal Presence of the JG $\beta$-Relaxation? Glassformers Only Showing a Non-JG Secondary Relaxation ............ 380
2.3.2.17 Change of $T$-Dependence of Relaxation Strength $\Delta \varepsilon_{\text{JG}}$ on Crossing $T_g$ ........................................ 395
2.3.2.18 Correlation of JG $\beta$-Relaxation with $\alpha$-Relaxation: Evidence from Spin-Lattice Relaxation Weighted Stimulated-Echo Spectroscopy .................................... 398
2.3.2.19 JG $\beta$-Relaxation in the Glassy State, like the $\alpha$-Relaxation, Is Sensitive to Thermodynamic $(T,P)$ Path, Thermal History, and Annealing .................................. 399
