Preface	vii
Notations	xvii
1 Basics	1
1.1 Introduction	1
Exercises	6
1.2 Linear Programming Prerequisites	7
1.2.1 Algebraic concepts and properties	7
1.2.2 Geometric interpretation	10
1.2.3 Duality statements	12
1.2.4 The Simplex method	16
1.2.5 The dual Simplex method	20
Exercises	22
1.2.6 Dual decomposition method	23
1.2.7 Nested decomposition	31
1.2.8 Regularized decomposition	46
1.2.9 Interior Point Methods	48
Exercises	53
1.3 Nonlinear Programming Prerequisites	54
1.3.1 Optimality Conditions	57
1.3.2 Solution methods	59
Cutting Planes: Outer Linearization (Kelley)	61
Cutting Planes: Outer Linearization (Veinott)	63
Cutting Planes: Outer Linearization (Zoutendijk)	65
A Central Cutting Plane Method (Elzinga–Moore)	66
Exercises	69
2 Single-stage SLP models	71
2.1 Introduction	71
Exercises	87

2.2	Models involving probability functions	87
2.2.1	Basic properties	91
2.2.2	Finite discrete distribution	93
2.2.3	Separate probability functions	95
	Only the right-hand-side is stochastic	97
	Multivariate normal distribution	98
	Stable distributions	106
	A distribution-free approach	111
2.2.4	The independent case	113
2.2.5	Joint constraints: random right-hand-side	115
	Generalized-concave probability measures	116
	Generalized-concave distribution functions	125
	Maximizing joint probability functions	128
2.2.6	Joint constraints: random technology matrix	129
2.2.7	Summary on the convex programming subclasses	134
	Exercises	136
2.3	Quantile functions, Value at Risk	137
2.4	Models based on expectation	140
2.4.1	Integrated chance constraints	142
	Separate integrated probability functions	142
	Joint integrated probability functions	147
2.4.2	A model involving conditional expectation	151
2.4.3	Conditional Value at Risk	152
	Exercises	158
2.5	Models built with deviation measures	159
2.5.1	Quadratic deviation	160
2.5.2	Absolute deviation	163
2.5.3	Quadratic semi-deviation	167
2.5.4	Absolute semi-deviation	170
	Exercises	171
2.6	Modeling risk and opportunity	171
2.7	Risk measures	173
2.7.1	Risk measures in finance	175
2.7.2	Properties of risk measures	177
2.7.3	Portfolio optimization models	181
2.7.4	Optimizing performance	183
	Exercises	188
3	SLP models with recourse	191
3.1	The general multi-stage SLP	191
3.2	The two-stage SLP: Properties and solution approaches	196
3.2.1	The complete fixed recourse problem (CFR)	198
	3.2.1.1 CFR: Direct bounds for the expected recourse $\mathcal{Q}(x)$	207
	3.2.1.2 CFR: Moment problems and bounds for $\mathcal{Q}(x)$	209
	3.2.1.3 CFR: Approximation by successive discretization	218

- DAPPROX: Approximating CFR solutions 223
- Exercises 224
- 3.2.2 The simple recourse case 226
 - 3.2.2.1 The standard simple recourse problem (SSR) 227
 - 3.2.2.2 SSR: Approximation by successive discretization 232
 - SRAPPROX: Approximating SSR solutions 235
 - 3.2.2.3 The multiple simple recourse problem 237
 - 3.2.2.4 The generalized simple recourse problem (GSR) 244
 - GSR-CUT: Solving GSR by successive cuts 247
- Exercises 249
- 3.2.3 CVaR and recourse problems 250
- 3.2.4 Some characteristic values for two-stage SLP's 255
- 3.3 The multi-stage SLP 260
 - 3.3.1 MSLP with finite discrete distributions 261
 - 3.3.2 MSLP with non-discrete distributions 266
- 4 Algorithms 285**
 - 4.1 Introduction 285
 - 4.2 Single-stage models with separate probability functions 285
 - 4.2.1 A guide to available software 287
 - 4.3 Single-stage models with joint probability functions 288
 - 4.3.1 Numerical considerations 289
 - 4.3.2 Cutting plane methods 293
 - 4.3.3 Other algorithms 295
 - 4.3.4 Bounds for the probability distribution function 296
 - 4.3.5 Computing probability distribution functions 303
 - A Monte-Carlo approach with antithetic variates 304
 - A Monte-Carlo approach based on probability bounds 306
 - 4.3.6 Finite discrete distributions 309
 - 4.3.7 A guide to available software 311
 - SLP problems with logconcave distribution functions 311
 - Evaluating probability distribution functions 311
 - SLP problems with finite discrete distributions 312
 - Exercises 312
 - 4.4 Single-stage models based on expectation 313
 - 4.4.1 Solving equivalent LP's 313
 - 4.4.2 Dual decomposition revisited 314
 - 4.4.3 Models with separate integrated probability functions 318
 - 4.4.4 Models involving CVaR 320
 - 4.4.5 Models with joint integrated probability functions 322
 - 4.4.6 A guide to available software 324
 - Models with separate integrated probability functions 324
 - Models with joint integrated probability functions 325
 - Models involving CVaR 325

- Exercises 325
- 4.5 Single-stage models involving VaR 325
- 4.6 Single-stage models with deviation measures 326
 - 4.6.1 A guide to available software 327
- 4.7 Two-stage recourse models 327
 - 4.7.1 Decomposition methods 328
 - 4.7.2 Successive discrete approximation methods 329
 - Computing the Jensen lower bound 330
 - Computing the E–M upper bound for an interval 331
 - Computing the bounds for a partition 333
 - The successive discrete approximation method 337
 - Implementation 341
 - Simple recourse 346
 - Other successive discrete approximation algorithms 350
 - 4.7.3 Stochastic algorithms 351
 - Sample average approximation (SAA) 351
 - Stochastic decomposition 357
 - Other stochastic algorithms 360
 - 4.7.4 Simple recourse models 361
 - 4.7.5 A guide to available software 361
 - Exercises 363
- 4.8 Multistage recourse models 364
 - 4.8.1 Finite discrete distribution 364
 - 4.8.2 Scenario generation 366
 - Bundle-based sampling 368
 - A moment-matching heuristics 369
 - 4.8.3 A guide to available software 375
- 4.9 Modeling systems for SLP 375
 - 4.9.1 Modeling systems for SLP 376
 - 4.9.2 SLP–IOR 377
 - General issues 378
 - Analyze tools and workbench facilities 379
 - Transformations 380
 - Scenario generation 380
 - The solver interface 380
 - System requirements and availability 382
- References** 383
- Exercises: Hints for answers** 405
- Index** 421
