Contents

1 Rotational Alignment and Bandcrossings ................................................ 1
  1.1 Introduction ..................................................................................... 1
  1.2 Rotational Alignment and Bandcrossings ........................................ 2
  1.3 Systematics of Bandcrossings .......................................................... 7
    1.3.1 Nomenclature for Quasiparticle Trajectories ......................... 8
    1.3.2 Quasiparticle Trajectories ......................................................... 9
    1.3.3 Neutron νi13/2 AB Bandcrossing Frequencies in
         Even–Even Nuclei ................................................................. 10
    1.3.4 Evidence of Decreased Pairing Energies in Odd-N Nuclei ........ 11
    1.3.5 Bandcrossings in A~120–130 Nuclei .................................. 12
    1.3.6 Delayed Bandcrossings in odd-Z A~160–170 Nuclei ............ 16
  1.4 Comments and Conclusions ............................................................. 20
  References .............................................................................................. 21

2 Magnetic Rotation ................................................................................. 23
  2.1 Introduction ..................................................................................... 23
  2.2 Magnetic Rotational Bands in the Pb Region ................................... 25
    2.2.1 General Nuclear Structure in Light Pb Nuclei ....................... 25
    2.2.2 The Magnetic Rotational Bands—Experimental Results ........ 26
    2.2.3 Theoretical Interpretation of the ∆I = 1 Bands .................... 44
    2.2.4 Band Termination ................................................................. 49
  2.3 Antimagnetic Rotation ...................................................................... 50
  References .............................................................................................. 53

3 Triaxial Strong Deformation and Wobbling Motion ............................. 55
  3.1 Introduction ..................................................................................... 55
  3.2 Triaxial Strong Deformation ........................................................... 55
  3.3 Triaxiality and Wobbling Motion ....................................................... 59
  3.4 Experimental Results—Even-N Lu Isotopes .................................. 61
  3.5 Discussion ....................................................................................... 70
    3.5.1 Experimental Evidence for Wobbling Motion ...................... 71
  3.6 Conclusion, Status and Outlook ....................................................... 76
  References .............................................................................................. 78
Contents

4 Chirality in Nuclei ................................................................................. 81
  4.1 Introduction .................................................................................... 81
  4.2 The Nuclear Chiral Phenomenon .................................................. 81
  4.3 Fingerprints of Nuclear Chirality .................................................... 83
  4.4 Experimental Results ................................................................. 84
    4.4.1 Odd–Odd Nuclei ................................................................. 84
    4.4.2 Odd-A Nuclei ....................................................................... 93
  4.5 Discussion .................................................................................... 99
  4.6 Conclusions and Perspectives ....................................................... 109
References .......................................................................................... 110

Partial List of Books, Review and Some Other Articles Mainly
in High Spin Nuclear Structure Physics .............................................. 113

Index .................................................................................................... 119
Exotic Nuclear Excitations
Pancholi, S.C.
2011, X, 122 p., Hardcover
