## Contents

1 Introduction ................................................................. 1  
  1.1 Control Systems, Models and Algorithms ....................... 2  
  1.2 Repetition and Iteration ............................................ 3  
    1.2.1 Periodic Demand Signals .................................... 3  
    1.2.2 Repetitive Control and Multipass Systems ................. 4  
    1.2.3 Iterative Control Examples ................................. 6  
  1.3 Dynamical Properties of Iteration: A Review of Ideas ....... 9  
  1.4 So What Do We Need? ................................................ 12  
    1.4.1 An Overview of Mathematical Techniques .................. 13  
    1.4.2 The Conceptual Basis for Algorithms ...................... 15  
  1.5 Discussion and Further Background Reading .................... 16  

2 Mathematical Methods .................................................. 19  
  2.1 Elements of Matrix Theory ....................................... 19  
  2.2 Quadratic Optimization and Quadratic Forms ................ 27  
    2.2.1 Completing the Square ...................................... 27  
    2.2.2 Singular Values, Lagrangians  
    and Matrix Norms .................................................. 28  
  2.3 Banach Spaces, Operators, Norms and Convergent  
    Sequences .................................................................. 29  
    2.3.1 Vector Spaces .................................................. 29  
    2.3.2 Normed Spaces ................................................ 31  
    2.3.3 Convergence, Closure, Completeness  
    and Banach Spaces ................................................ 33  
    2.3.4 Linear Operators and Dense Subsets ....................... 34  
  2.4 Hilbert Spaces .......................................................... 37  
    2.4.1 Inner Products and Norms .................................... 37  
    2.4.2 Norm and Weak Convergence .................................. 39  
    2.4.3 Adjoint and Self-adjoint Operators  
    in Hilbert Space .................................................... 41
2.5 Real Hilbert Spaces, Convex Sets and Projections ............... 46
2.6 Optimal Control Problems in Hilbert Space .......................... 48
  2.6.1 Proof by Completing the Square ................................. 50
  2.6.2 Proof Using the Projection Theorem ............................. 51
  2.6.3 Discussion .................................................. 52
2.7 Further Discussion and Bibliography .................................. 53

3 State Space Models .................................................. 55
  3.1 Models of Continuous State Space Systems ......................... 57
    3.1.1 Solution of the State Equations ............................. 58
    3.1.2 The Convolution Operator and the Impulse Response .......... 59
    3.1.3 The System as an Operator Between Function Spaces .......... 59
  3.2 Laplace Transforms .............................................. 60
  3.3 Transfer Function Matrices, Poles, Zeros and Relative Degree .... 61
  3.4 The System Frequency Response .................................. 63
  3.5 Discrete Time, Sampled Data State Space Models ................ 64
    3.5.1 State Space Models as Difference Equations ................. 64
    3.5.2 Solution of Linear, Discrete Time State Equations .......... 65
    3.5.3 The Discrete Convolution Operator and the Discrete Impulse Response Sequence .......... 66
  3.6 \mathcal{Z}-Transforms and the Discrete Transfer Function Matrix ... 67
    3.6.1 Discrete Transfer Function Matrices, Poles, Zeros and the Relative Degree .......... 68
    3.6.2 The Discrete System Frequency Response ..................... 69
  3.7 Multi-rate Discrete Time Systems .................................. 70
  3.8 Controllability, Observability, Minimal Realizations and Pole Allocation .................. 70
  3.9 Inverse Systems .................................................. 72
    3.9.1 The Case of $m = \ell$, Zeros and $v^\ast$ .................... 72
    3.9.2 Left and Right Inverses When $m \neq \ell$ .................... 74
  3.10 Quadratic Optimal Control of Linear Continuous Systems ....... 76
    3.10.1 The Relevant Operators and Spaces .......................... 76
    3.10.2 Computation of the Adjoint Operator ......................... 78
    3.10.3 The Two Point Boundary Value Problem ....................... 81
    3.10.4 The Riccati Equation and a State Feedback Plus Feedforward Representation .......... 82
    3.10.5 An Alternative Riccati Representation ....................... 84
  3.11 Further Reading and Bibliography ............................... 85
Contents

4 Matrix Models, Supervectors and Discrete Systems
4.1 Supervectors and the Matrix Model .......................... 87
4.2 The Algebra of Series and Parallel Connections ............... 88
4.3 The Transpose System and Time Reversal ..................... 89
4.4 Invertibility, Range and Relative Degrees .................... 90
   4.4.1 The Relative Degree and the Kernel and Range of $G$ ............... 92
   4.4.2 The Range of $G$ and Decoupling Theory ................. 93
4.5 The Range and Kernel and the Use of the Inverse System ....... 96
   4.5.1 A Partition of the Inverse .................................. 96
   4.5.2 Ensuring Stability of $P^{-1}(z)$ ......................... 98
4.6 The Range, Kernel and the $C^*$ Canonical Form ............. 99
   4.6.1 Factorization Using State Feedback and Output Injection .... 99
   4.6.2 The $C^*$ Canonical Form .................................. 100
   4.6.3 The Special Case of Uniform Rank Systems ............... 102
4.7 Quadratic Optimal Control of Linear Discrete Systems ...... 104
   4.7.1 The Adjoint and the Discrete Two Point Boundary Value Problem .......... 105
   4.7.2 A State Feedback/Feedforward Solution .................. 106
4.8 Frequency Domain Relationships ................................ 107
   4.8.1 Bounding Norms on Finite Intervals ....................... 108
   4.8.2 Computing the Norm Using the Frequency Response ......... 109
   4.8.3 Quadratic Forms and Positive Real Transfer Function Matrices .......... 110
   4.8.4 Frequency Dependent Lower Bounds ....................... 112
4.9 Discussion and Further Reading ................................ 116

5 Iterative Learning Control: A Formulation .................. 119
5.1 Abstract Formulation of a Design Problem .................... 119
   5.1.1 The Design Problem ....................................... 120
   5.1.2 Input and Error Update Equations: The Linear Case ........... 123
   5.1.3 Robustness and Uncertainty Models ....................... 124
5.2 General Conditions for Convergence of Linear Iterations .... 128
   5.2.1 Spectral Radius and Norm Conditions ..................... 129
   5.2.2 Infinite Dimensions with $r(L) = \|L\| = 1$ and $L = L^*$ .......... 132
   5.2.3 Relaxation, Convergence and Robustness .................. 134
   5.2.4 Eigenstructure Interpretation ............................. 138
   5.2.5 Formal Computation of the Eigenvalues and Eigenfunctions .......... 139
5.3 Robustness, Positivity and Inverse Systems ..................... 141
5.4 Discussion and Further Reading .................................... 143

6 Control Using Inverse Model Algorithms .......................... 145
6.1 Inverse Model Control: A Benchmark Algorithm .............. 145
   6.1.1 Use of a Right Inverse of the Plant ....................... 145
   6.1.2 Use of a Left Inverse of the Plant ......................... 147
   6.1.3 Why the Inverse Model Is Important ....................... 149
   6.1.4 Inverse Model Algorithms for State Space Models .......... 151
   6.1.5 Robustness Tests and Multiplicative Error Models .......... 152
6.2 Frequency Domain Robustness Criteria ......................... 156
   6.2.1 Discrete System Robust Monotonicity Tests .............. 156
   6.2.2 Improving Robustness Using Relaxation ................. 158
   6.2.3 Discrete Systems: Robustness and Non-monotonic Convergence .... 159
6.3 Discussion and Further Reading ................................ 161

7 Monotonicity and Gradient Algorithms .......................... 165
7.1 Steepest Descent: Achieving Minimum Energy Solutions ...... 166
7.2 Application to Discrete Time State Space Systems .......... 168
   7.2.1 Algorithm Construction ................................. 169
   7.2.2 Eigenstructure Interpretation: Convergence in Finite Iterations .... 171
   7.2.3 Frequency Domain Attenuation ........................... 174
7.3 Steepest Descent for Continuous Time State Space Systems .................................................. 178
7.4 Monotonic Evolution Using General Gradients .............. 180
7.5 Discrete State Space Models Revisited ....................... 183
   7.5.1 Gradients Using the Adjoint of a State Space System ........ 183
   7.5.2 Why the Case of $m = \ell$ May Be Important in Design ......................... 192
   7.5.3 Robustness Tests in the Frequency Domain .............. 194
   7.5.4 Robustness and Relaxation ............................... 197
   7.5.5 Non-monotonic Gradient-Based Control and $\varepsilon$-Weighted Norms ................. 198
   7.5.6 A Steepest Descent Algorithm Using $\varepsilon$-Noms ........ 203
7.6 Discussion, Comments and Further Generalizations .......... 203
   7.6.1 Bringing the Ideas Together? .......................... 204
   7.6.2 Factors Influencing Achievable Performance .......... 206
   7.6.3 Notes on Continuous State Space Systems ................ 207
