# Contents

1 Introduction ........................................ 1  
 1.1 Control Systems, Models and Algorithms .............. 2  
 1.2 Repetition and Iteration ............................. 3  
    1.2.1 Periodic Demand Signals ....................... 3  
    1.2.2 Repetitive Control and Multipass Systems ...... 4  
    1.2.3 Iterative Control Examples .................... 6  
 1.3 Dynamical Properties of Iteration: A Review of Ideas . . 9  
 1.4 So What Do We Need? ................................ 12  
    1.4.1 An Overview of Mathematical Techniques ........ 13  
    1.4.2 The Conceptual Basis for Algorithms .......... 15  
 1.5 Discussion and Further Background Reading ............. 16  

2 Mathematical Methods ................................ 19  
 2.1 Elements of Matrix Theory ........................... 19  
 2.2 Quadratic Optimization and Quadratic Forms .......... 27  
    2.2.1 Completing the Square ......................... 27  
    2.2.2 Singular Values, Lagrangians  
       and Matrix Norms ............................... 28  
 2.3 Banach Spaces, Operators, Norms and Convergent  
       Sequences ..................................... 29  
    2.3.1 Vector Spaces ................................ 29  
    2.3.2 Normed Spaces ............................... 31  
    2.3.3 Convergence, Closure, Completeness  
       and Banach Spaces ............................ 33  
    2.3.4 Linear Operators and Dense Subsets .......... 34  
 2.4 Hilbert Spaces ..................................... 37  
    2.4.1 Inner Products and Norms ..................... 37  
    2.4.2 Norm and Weak Convergence .................... 39  
    2.4.3 Adjoint and Self-adjoint Operators  
       in Hilbert Space ............................. 41
### 2.5 Real Hilbert Spaces, Convex Sets and Projections  
#### 2.5 Optimal Control Problems in Hilbert Space  
- **2.6.1** Proof by Completing the Square  
- **2.6.2** Proof Using the Projection Theorem  
- **2.6.3** Discussion  
#### 2.7 Further Discussion and Bibliography  

### 3 State Space Models  
#### 3.1 Models of Continuous State Space Systems  
- **3.1.1** Solution of the State Equations  
- **3.1.2** The Convolution Operator and the Impulse Response  
- **3.1.3** The System as an Operator Between Function Spaces  
#### 3.2 Laplace Transforms  
#### 3.3 Transfer Function Matrices, Poles, Zeros and Relative Degree  
#### 3.4 The System Frequency Response  
#### 3.5 Discrete Time, Sampled Data State Space Models  
- **3.5.1** State Space Models as Difference Equations  
- **3.5.2** Solution of Linear, Discrete Time State Equations  
- **3.5.3** The Discrete Convolution Operator and the Discrete Impulse Response Sequence  
#### 3.6 $\mathcal{Z}$-Transforms and the Discrete Transfer Function Matrix  
- **3.6.1** Discrete Transfer Function Matrices, Poles, Zeros and the Relative Degree  
- **3.6.2** The Discrete System Frequency Response  
#### 3.7 Multi-rate Discrete Time Systems  
#### 3.8 Controllability, Observability, Minimal Realizations and Pole Allocation  
#### 3.9 Inverse Systems  
- **3.9.1** The Case of $m = \ell$, Zeros and $v^\dagger$  
- **3.9.2** Left and Right Inverses When $m \neq \ell$  
#### 3.10 Quadratic Optimal Control of Linear Continuous Systems  
- **3.10.1** The Relevant Operators and Spaces  
- **3.10.2** Computation of the Adjoint Operator  
- **3.10.3** The Two Point Boundary Value Problem  
- **3.10.4** The Riccati Equation and a State Feedback Plus Feedforward Representation  
- **3.10.5** An Alternative Riccati Representation  
#### 3.11 Further Reading and Bibliography
## Matrix Models, Supervectors and Discrete Systems

5.3 Robustness, Positivity and Inverse Systems .................................................. 141
5.4 Discussion and Further Reading .................................................................... 143

6 Control Using Inverse Model Algorithms ......................................................... 145
6.1 Inverse Model Control: A Benchmark Algorithm ........................................... 145
6.1.1 Use of a Right Inverse of the Plant ............................................................. 145
6.1.2 Use of a Left Inverse of the Plant ............................................................... 147
6.1.3 Why the Inverse Model Is Important ........................................................... 149
6.1.4 Inverse Model Algorithms for State Space Models ........................................ 151
6.1.5 Robustness Tests and Multiplicative Error Models ....................................... 152
6.2 Frequency Domain Robustness Criteria ......................................................... 156
6.2.1 Discrete System Robust Monotonicity Tests ............................................... 156
6.2.2 Improving Robustness Using Relaxation .................................................... 158
6.2.3 Discrete Systems: Robustness and Non-monotonic Convergence .................. 159
6.3 Discussion and Further Reading .................................................................... 161

7 Monotonicity and Gradient Algorithms ............................................................. 165
7.1 Steepest Descent: Achieving Minimum Energy Solutions ............................... 166
7.2 Application to Discrete Time State Space Systems .......................................... 168
7.2.1 Algorithm Construction ............................................................................... 169
7.2.2 Eigenstructure Interpretation: Convergence in Finite Iterations .................. 171
7.2.3 Frequency Domain Attenuation .................................................................. 174
7.3 Steepest Descent for Continuous Time State Space Systems ......................... 178
7.4 Monotonic Evolution Using General Gradients .............................................. 180
7.5 Discrete State Space Models Revisited ............................................................. 183
7.5.1 Gradients Using the Adjoint of a State Space System .................................. 183
7.5.2 Why the Case of $m = \ell$ May Be Important in Design ............................... 192
7.5.3 Robustness Tests in the Frequency Domain ............................................... 194
7.5.4 Robustness and Relaxation ...................................................................... 197
7.5.5 Non-monotonic Gradient-Based Control and $\varepsilon$-Weighted Norms ............ 198
7.5.6 A Steepest Descent Algorithm Using $\varepsilon$-Norms ...................................... 203
7.6 Discussion, Comments and Further Generalizations ...................................... 203
7.6.1 Bringing the Ideas Together? ..................................................................... 204
7.6.2 Factors Influencing Achievable Performance ............................................ 206
7.6.3 Notes on Continuous State Space Systems ................................................. 207
9.4.4 Robustness and the Inverse Algorithm ........................................ 274
9.4.5 Alternatives? ................................................................. 275
9.4.6 \(Q, R\) and Dyadic Expansions ................................................. 276

10 NOILC: Natural Extensions ............................................................. 277
10.1 Filtering Using Input and Error Weighting ..................................... 277
10.2 Multi-rate Sampled Discrete Time Systems ..................................... 279
10.3 Initial Conditions as Control Signals .............................................. 280
10.4 Problems with Several Objectives ................................................ 284
10.5 Intermediate Point Problems ....................................................... 286
   10.5.1 Continuous Time Systems:
       An Intermediate Point Problem ................................................. 286
   10.5.2 Discrete Time Systems: An Intermediate
       Point Problem ........................................................................ 290
   10.5.3 IPNOILC: Additional Issues and Robustness ............................. 290
10.6 Multi-task NOILC ......................................................................... 293
   10.6.1 Continuous State Space Systems ............................................ 294
   10.6.2 Adding Initial Conditions as Controls ....................................... 299
   10.6.3 Discrete State Space Systems ................................................ 300
10.7 Multi-models and Predictive NOILC ............................................... 301
   10.7.1 Predictive NOILC—General Theory
       and a Link to Inversion ............................................................ 301
   10.7.2 A Multi-model Representation ............................................... 304
   10.7.3 The Case of Linear, State Space Models ................................. 305
   10.7.4 Convergence and Other Algorithm Properties .......................... 308
   10.7.5 The Special Cases of \(M = 2\) and \(M = \infty\) ......................... 313
   10.7.6 A Note on Robustness of Feedforward
       Predictive NOILC ................................................................. 315
10.8 Discussion and Further Reading ..................................................... 319

11 Iteration and Auxiliary Optimization ............................................... 323
11.1 Models with Auxiliary Variables and Problem
   Formulation ................................................................................. 323
11.2 A Right Inverse Model Solution .................................................... 325
11.3 Solutions Using Switching Algorithms .......................................... 327
   11.3.1 Switching Algorithm Construction ........................................... 327
   11.3.2 Properties of the Switching Algorithm ...................................... 328
   11.3.3 Characterization of Convergence Rates ..................................... 331
   11.3.4 Decoupling Minimum Energy Representations
       from NOILC ........................................................................ 333
   11.3.5 Intermediate Point Tracking
       and the Choice \(G_1 = G\) ......................................................... 334
   11.3.6 Restructuring the NOILC Spectrum
       by Choosing \(G_1 = G_e\) ......................................................... 335
11.4 A Note on Robustness of Switching Algorithms .......................... 338
11.5 The Switching Algorithm When $G_rG^*$ Is Invertible ................. 341
11.6 Discussion and Further Reading ............................................. 344

12 Iteration as Successive Projection ............................................ 347
12.1 Convergence Versus Proximity .............................................. 347
12.2 Successive Projection and Proximity Algorithms ......................... 349
12.3 Iterative Control with Constraints ......................................... 354
  12.3.1 NOLC with Input Constraints ........................................ 355
  12.3.2 General Analysis ...................................................... 358
  12.3.3 Intermediate Point Control with Input and Output Constraints .... 362
  12.3.4 Iterative Control to Satisfy Auxiliary Variable Bounds ............ 364
  12.3.5 An Overview and Summary ........................................... 366
12.4 “Iteration Management” by Operator Intervention ....................... 367
12.5 What Happens If $S_1$ and $S_2$ Do Not Intersect? ...................... 370
12.6 Discussion and Further Reading ............................................. 373

13 Acceleration and Successive Projection ...................................... 377
13.1 Replacing Plant Iterations by Off-Line Iterations ....................... 378
13.2 Accelerating Algorithms Using Extrapolation ............................ 378
  13.2.1 Successive Projection and Extrapolation Algorithms ................ 379
  13.2.2 NOLC: Acceleration Using Extrapolation .......................... 381
13.3 A Notch Algorithm Using Parameterized Sets ............................. 383
  13.3.1 Creating a Spectral Notch: Computation and Properties ............ 383
  13.3.2 The Notch Algorithm and Iterative Control Using Successive Projection ......................................................... 389
  13.3.3 A Notch Algorithm for Discrete State Space Systems .............. 393
  13.3.4 Robustness of the Notch Algorithm in Feedforward Form ........ 396
13.4 Discussion and Further Reading ............................................. 401

14 Parameter Optimal Iterative Control ......................................... 403
14.1 Parameterizations and Norm Optimal Iteration .......................... 403
14.2 Parameter Optimal Control: The Single Parameter Case .............. 408
  14.2.1 Alternative Objective Functions .................................... 408
  14.2.2 Problem Definition and Convergence Characterization ............. 410
  14.2.3 Convergence Properties: Dependence on Parameters ............... 413
