Prologue .................................................................................................................. xvii

Part I Simple Single Species Models

1 Continuous Population Models ................................................................. 3
  1.1 Exponential Growth ................................................................. 3
  1.2 The Logistic Population Model .............................................. 8
  1.3 The Logistic Equation in Epidemiology ......................... 13
  1.4 Qualitative Analysis ........................................................... 17
  1.5 Harvesting in Population Models ................................... 26
     1.5.1 Constant-Yield Harvesting .................................. 26
     1.5.2 Constant-Effort Harvesting .................................. 28
  1.6 Eutrophication of a Lake: A Case Study ......................... 31
  1.7 Appendix: Parameters in Biological Systems ............... 38
  1.8 Project: The Spruce Budworm ....................................... 42
  1.9 Project: Estimating the Population of the United States .... 45

2 Discrete Population Models ................................................................. 49
  2.1 Introduction: Linear Models ............................................ 49
  2.2 Graphical Solution of Difference Equations ................. 53
  2.3 Equilibrium Analysis ..................................................... 56
  2.4 Period-Doubling and Chaotic Behavior ......................... 61
  2.5 Discrete–Time Metered Models .................................. 67
  2.6 A Two-Age Group Model and Delayed Recruitment ........ 70
  2.7 Systems of Two Difference Equations ......................... 76
  2.8 Oscillation in Flour Beetle Populations: A Case Study .... 80
  2.9 Project: A Discrete SIS Epidemic Model .................... 86
  2.10 Project: A Discrete-Time Two-Sex Pair-Formation Model .... 88

# Contents

6  **Harvesting in Two-species Models**  ........................................ 223
  6.1  Harvesting of Species in Competition  ............................... 223
  6.2  Harvesting of Predator–Prey Systems  .............................. 229
  6.3  Intermittent Harvesting of Predator–Prey Systems  ............ 237
  6.4  Some Economic Aspects of Harvesting  ............................. 242
  6.5  Optimization of Harvesting Returns  .................................. 247
  6.6  Justification of the Optimization Result  .......................... 251
  6.7  A Nonlinear Optimization Problem  .................................... 254
  6.8  Economic Interpretation of the Maximum Principle ............. 260
  6.9  Project: A Harvesting Model  .......................................... 263
  6.10 Project: Harvesting of Two Species  ................................. 264

Part III  **Structured Population Models**

7  **Models for Populations with Age Structure**  ...................... 267
  7.1  Linear Discrete Models .................................................. 267
  7.2  Linear Continuous Models ............................................... 273
  7.3  The Method of Characteristics ......................................... 275
  7.4  Nonlinear Continuous Models .......................................... 281
  7.5  Models with Discrete Age Groups .................................... 288
  7.6  Project: Ordinary Differential Equations with Age Structure ... 290
  7.7  Project: Nonlinear Age Structured Population Growth .......... 290
  7.8  Project: A Size Structured Population Model ..................... 291

8  **Models for Populations with Spatial Structure** .................... 293
  8.1  Introduction .............................................................. 293
  8.2  Some Simple Examples of Metapopulation Models ................. 294
  8.3  A General Metapopulation Model .................................... 297
  8.4  A Metapopulation Model with Residence and Travel ............. 299
  8.5  The Diffusion Equation .................................................. 301
  8.6  Solution by Separation of Variables .................................. 304
  8.7  Solutions in Unbounded Regions ....................................... 314
  8.8  Linear Reaction–Diffusion Equations ................................ 321
  8.9  Nonlinear Reaction–Diffusion Equations ......................... 323
    8.9.1  Two-Species Interactions ......................................... 326
  8.10 Diffusion in Two Dimensions .......................................... 330
  8.11 Project: Cats and Birds in Space .................................... 332
  8.12 Project: The Cable Equation .......................................... 333
  8.13 Project: Some Equations of Diffusion Type ....................... 335
Part IV Disease Transmission Models

9 Epidemic Models ............................... 345
  9.1 Introduction to Epidemic Models ............................. 345
  9.2 The Simple Kermack–McKendrick Epidemic Model  .............. 350
  9.3 A Branching-Process Disease-Outbreak Model .................. 361
    9.3.1 Transmissibility ...................................... 367
  9.4 Network and Compartmental Epidemic Models ................. 369
  9.5 More Complicated Epidemic Models ............................ 373
    9.5.1 Exposed Periods ......................................... 373
    9.5.2 Treatment Models ......................................... 375
    9.5.3 An Influenza Model ...................................... 376
    9.5.4 A Quarantine-Isolation Model .............................. 377
  9.6 An SIR Model with a General Infectious Period Distribution .... 382
  9.7 The Age of Infection Epidemic Model ........................... 384
  9.8 Models with Disease Deaths .................................... 388
  9.9 A Vaccination Model ........................................... 391
  9.10 The Next Generation Matrix ................................... 393
    9.10.1 A Global Asymptotic Stability Result ..................... 403
  9.11 Directions for Generalization ................................... 404
  9.12 Some Warnings ................................................ 404
  9.13 Project: Discrete Epidemic Models ............................. 405
  9.14 Project: Fitting Data for an Influenza Model ............... 407
  9.15 Project: Social Interactions ................................... 407

10 Models for Endemic Diseases .............................. 411
  10.1 A Model for Diseases with No Immunity ...................... 411
  10.2 The SIR Model with Births and Deaths .......................... 414
  10.3 Some Applications .............................................. 420
    10.3.1 Herd Immunity .............................................. 420
    10.3.2 Age at Infection ........................................... 421
    10.3.3 The Interepidemic Period .................................. 422
    10.3.4 “Epidemic” Approach to Endemic Equilibrium ............... 424
    10.3.5 The SIS Model with Births and Deaths ..................... 425
  10.4 Temporary Immunity .............................................. 427
  10.5 Diseases as Population Control ................................ 431
  10.6 Parameter Estimation: Ordinary Least Squares ............... 434
    10.6.1 Connecting Models to Data ................................ 434
    10.6.2 Ordinary Least Squares (OLS) Estimation ................... 436
  10.7 Possible Extensions ............................................. 441
  10.8 Project: Pulse Vaccination ....................................... 443
  10.9 Project: A Model with Competing Disease Strains ............. 445
10.10 Project: An Epidemic Model in Two Patches ...................... 447
10.11 Project: Population Growth and Epidemics ..................... 448
10.12 Project: Estimating Parameters for Leishmaniasis .............. 453
10.13 Project: Invasive Pneumococcal Disease Surveillance Data .... 457

Epilogue ................................................................................. 465
