1 Electroencephalography ................................................................. 1
  1.1 Introduction .................................................................................. 1
  1.2 Brief History of EEG ................................................................. 2
  1.3 Recording of EEG Signals ......................................................... 5
    1.3.1 Scalp EEG Recordings .......................................................... 5
    1.3.2 Artifacts ................................................................................ 6
    1.3.3 Intracranial Recordings ......................................................... 7
    1.3.4 Electrocorticography ............................................................. 8
    1.3.5 Local Field Potentials ......................................................... 9
  1.4 Evoked Potentials ......................................................................... 9
    1.4.1 Visual Evoked Potentials ...................................................... 10
    1.4.2 Auditory Evoked Potentials ................................................. 11
    1.4.3 Somatosensory Evoked Potentials ....................................... 11
  1.5 Evoked Potentials and Cognition ............................................... 11
    1.5.1 Oddball Paradigm and the P300 ......................................... 12
    1.5.2 Mismatch Negativity (MMN) ............................................... 13
    1.5.3 Omitted Evoked Potentials ................................................... 13
    1.5.4 Contingent Negative Variation (CNV) .................................. 14
    1.5.5 N400 ..................................................................................... 14
    1.5.6 Error-related Negativity (ERN) ........................................... 14
  1.6 Basic Analysis of Evoked Potentials ............................................ 14
    1.6.1 Topography and Source Localization .................................. 16
    1.6.2 Event-Related Oscillations ............................................... 16
  References .......................................................................................... 17

2 Frequency Analysis ......................................................................... 21
  2.1 Introduction .................................................................................. 21
  2.2 The Continuous Fourier Transform ............................................ 22
  2.3 The Discrete Fourier Transform ............................................... 23
  2.4 Aliasing ....................................................................................... 24

5.9 A New Mechanism of Sleep-Induced Learning Revealed by Single-Trial Analysis .................................................. 80
5.10 Summary ........................................................................................................ 84
References ........................................................................................................ 84

6 Basic Concepts for Spatial Analysis ................................................................. 87
6.1 Introduction ....................................................................................................... 87
6.2 State Variables and Their Interrelations: Gains ....................................... 89
  6.2.1 State Variables: Axon Pulses Versus Dendritic Waves .................... 89
  6.2.2 State Variables: Microscopic Bits Versus Macroscopic Densities ....... 91
  6.2.3 State Variables: The Order Parameter .............................................. 93
6.3 Temporal and Spatial Textures: Gaussianity .............................................. 94
6.4 Stationarity of Spatial Patterns ................................................................. 97
  6.4.1 Invariance of Analytic Frequency: The Hilbert Transform ............... 98
  6.4.2 Spatial Pattern Invariance of Analytic Amplitude ......................... 99
  6.4.3 Estimating Broad-Spectrum Coherence ......................................... 100
  6.4.4 Spatial AM Pattern Classification ................................................ 102
6.5 Linearity: Additivity and Proportionality ................................................ 103
6.6 Ergodicity, Wave-to-Pulse Conversion, and Static Nonlinearity .......... 106
6.7 Positive Feedback, Stability, and Point Attractor .................................. 110
6.8 Negative Feedback, Conditional Stability, and Limit Cycle Attractor ...... 113
6.9 Criticality: Choice by Means of an Attractor Landscape ....................... 115
6.10 Summary ...................................................................................................... 118
