Preface

This book is written by professionals from 11 countries of America, Europe, Asia, and Africa. All the time and expertise donated by the authors to this project are gratefully acknowledged. Nine chapters of the book are devoted to evaluation of achievements and drawbacks in our understanding of the profound versatility of different groups of plant-associated bacteria and their ability to radically alter the mode of their interactions with plants or to infect animal organisms, including humans. Hopefully, the interested reader will find these up-to-date reviews helpful and thought-provoking.

My heartfelt gratitude is to Eric Stannard, Editor, Botany, Springer Science + Business Media, New York, for the very idea of book publishing with Springer and for his continuous advice and support during the 1.5-year span of this book preparation. Special thanks are to Portia Levasseur, Developmental Editor, for timely harmonization of our writing and editing efforts. Professional support from Andy Kwan, Assistant Editor, and other members of the Springer’s team is also appreciated. I thank my colleagues from IBPPM RAS (Saratov, Russia) for many years of collaboration and the Russian Foundation for Basic Research for partial support of our studies of plant-associated bacteria.
