List of Contributors	xxi
Introduction by the Editors	xxiii
1 Introduction	
<i>Bo Wahlberg, Brett Ninness, Paul Van den Hof</i>	1
1.1 Why Orthonormal Basis Functions?	1
1.2 Preliminaries; Notation	2
1.2.1 Transfer Function, Impulse Response, and Frequency Response	2
1.2.2 State-space Model	2
1.2.3 Function Spaces and Inner Products	3
1.2.4 Cross-Gramian	3
1.2.5 Norm and Orthonormality	4
1.2.6 Impulse Response	4
1.2.7 Convergence and Completeness	4
1.3 Motivating Example from System Identification	5
1.3.1 ARX Model Estimation	5
1.3.2 OE Model Estimation	6
1.3.3 FIR Model Estimation	7
1.3.4 Summary	7
1.4 From Pole Selection to Basis Functions	7
1.4.1 Fixed Denominator Model	8
1.4.2 Rational Basis Functions	8
1.4.3 Pole Locations	9
1.4.4 Continuous Time	9
1.5 Historical Overview	10

2 Construction and Analysis

Bo Wahlberg, Tomás Oliveira e Silva 15

2.1 Objectives 15

2.2 Rational Orthogonal Functions 15

 2.2.1 Notation 15

 2.2.2 The Gram-Schmidt Procedure 16

 2.2.3 The Takenaka-Malmquist Functions 18

 2.2.4 Error Bounds 18

 2.2.5 Completeness 19

 2.2.6 Real Impulse Response 20

2.3 State-space Theory 21

 2.3.1 Introduction 21

 2.3.2 State Covariance Matrix 22

 2.3.3 Input Balanced State-space Realization 22

 2.3.4 Construction Method 24

2.4 All-pass Transfer Function 24

 2.4.1 Orthogonal State-space Models 25

 2.4.2 Connections of All-pass Filters 26

 2.4.3 Feedback Connections of All-pass Filters 27

 2.4.4 Orthogonal Filters Based on Feedback of Resonators 28

 2.4.5 Basic Orthogonal All-pass Filters 29

2.5 Cascade Structures 30

2.6 Ladder Structures 33

 2.6.1 Schur Algorithm 33

 2.6.2 Recursion 35

 2.6.3 Gray-Markel Normalized Ladder Form 35

2.7 Reproducing Kernels 36

 2.7.1 Derivation 36

 2.7.2 Orthonormal Basis 37

 2.7.3 Weighted Spaces and Gramians 38

 2.7.4 Convergence 39

3 Transformation Analysis

Bo Wahlberg 41

3.1 Introduction 41

 3.1.1 Outline 41

 3.1.2 Notation 42

3.2 The Laguerre Functions 42

 3.2.1 Bilinear Transformation 43

 3.2.2 Isomorphism 43

 3.2.3 The Laguerre Functions 45

 3.2.4 Basic Properties 45

3.3 Generalized Orthonormal Basis Functions 47

 3.3.1 Multi-linear Transformation 47

 3.3.2 Outline 49

3.3.3	A Root-locus Approach	49
3.3.4	Eigenvalues and Eigenvectors	50
3.3.5	The Christoffel-Darboux Formula	50
3.3.6	Eigenvalue Decomposition	50
3.3.7	Measure of Integration	51
3.3.8	The Function $W_0(\lambda)$	51
3.3.9	Summary	52
3.3.10	The Hambo Transform	52
3.3.11	Transformation of Poles and Zeros	53
3.3.12	Transformation of All-pass Transfer Function	53
3.3.13	The Inverse Hambo Transform	53
3.3.14	The Hambo Signal Transform	53
3.3.15	Isomorphism	54
3.3.16	Generalized Orthonormal Basis Functions	55
3.3.17	Rate of Convergence	56
3.4	State Covariance Matrix Results	56
3.4.1	Transformation of Spectra	57
3.4.2	Key Results	57
3.4.3	Approximative Factorizations	58
3.4.4	Approximative Spectral Density Results	59

4 System Identification with Generalized Orthonormal Basis Functions

	<i>Paul Van den Hof, Brett Ninness</i>	61
4.1	Introduction	61
4.2	Prediction Error Identification	63
4.2.1	Identification Setting and Prediction	63
4.2.2	Model Structures and Model Sets	65
4.2.3	Convergence and Consistency Results	68
4.2.4	Asymptotic Bias and Variance Errors	69
4.2.5	Linear Regression	73
4.3	Identification with Basis Function Model Structures	75
4.3.1	Introduction	75
4.3.2	Least Squares Identification	75
4.3.3	Asymptotic Bias Results	78
4.3.4	Asymptotic Variance Results	88
4.4	Relations with Other Model Structures	92
4.4.1	Introduction	92
4.4.2	Fixed Denominator Models	93
4.4.3	ARX and More General Structures	100
4.5	Summary	101
4.6	Bibliography	102

5 Variance Error, Reproducing Kernels, and Orthonormal Bases

<i>Brett Ninness, Håkan Hjalmarsson</i>	103
5.1 Introduction	103
5.2 Motivation	104
5.3 Problem Formulation	106
5.4 Reproducing Kernels	109
5.5 Variance Error and the Reproducing Kernel	112
5.6 Function Spaces Implied by Model Structures	115
5.6.1 Fixed Denominator (Generalized FIR) Structure	115
5.6.2 Box-Jenkins Structure	116
5.6.3 Output-error Structure	117
5.6.4 ARMAX Structure	117
5.7 Exact Variance Quantifications	118
5.7.1 Variability of Fixed Denominator Model Structures	119
5.7.2 Variability of Output-error Model Structures	121
5.7.3 Variability of Box-Jenkins Model Structures	123
5.7.4 Further Simulation Example	126
5.8 Variance Quantification in the General Case	130
5.8.1 Technical Preliminaries	132
5.8.2 Kernel and Variance Approximation: A First Approach	134
5.8.3 Genesis of Impaired Approximation	137
5.8.4 Improved Variance Approximation via Basis Adaptation	139
5.8.5 Further Improvement via a Focus on Kernel Approximations	140
5.8.6 Variance Quantification for General Input Spectral Densities	145
5.9 Further Simulation Example	150
5.10 Conclusions and Further Reading	153

6 Numerical Conditioning

<i>Brett Ninness, Håkan Hjalmarsson</i>	161
6.1 Introduction	161
6.2 Problem Setting and Motivation	162
6.3 Existence of Spectra	167
6.4 Two-dimensional Example	168
6.5 Higher Dimensions	170
6.6 Robustness in Two-dimensional Case	173
6.7 Higher Dimensions Again	176
6.8 Conditions for Numerical Superiority	177
6.9 Asymptotic Analysis	182
6.10 Convergence Rates and Numerical Conditioning	186
6.11 Conclusions	187

7 Model Uncertainty Bounding

Paul Van den Hof 189

7.1 Introduction 189

7.2 Prediction Error Identification with Full-order Model Structures . . 189

7.3 Prediction Error Identification with Reduced-order Model Structures 193

7.3.1 Introduction 193

7.3.2 A Computational Approach to Probabilistic/Worst-case Error Bounding 193

7.3.3 A Mixed Probabilistic Worst-case Approach with Periodic Inputs 201

7.3.4 Stochastic Embedding 206

7.3.5 Model Error Modelling 209

7.4 Bounded Error Identification 210

7.5 Summary 212

8 Frequency-domain Identification in \mathcal{H}_2

József Bokor, Zoltan Szabó 213

8.1 Introduction 213

8.1.1 Basic Notation 216

8.2 Model Parameterization with Orthonormal Basis Functions 217

8.2.1 Least Squares Identification 219

8.2.2 Asymptotic Bias Results 220

8.2.3 Asymptotic Variance Results 221

8.3 Approximation by Rational Orthonormal Functions on the Unit Circle 221

8.3.1 The β Function 222

8.3.2 Reproducing Kernels 224

8.3.3 L_p Norm Convergence of the Partial Sums 226

8.4 A Discrete Rational Orthonormal System on the Unit Circle 227

8.4.1 A Quadrature Formula for Rational Functions on the Unit Circle 229

8.4.2 L_p Norm Convergence of Certain Rational Interpolation Operators on the Unit Circle 230

8.5 Asymptotic Results for Adapted Nodes 231

8.6 Computational Algorithm 232

8.7 Concluding Remarks 233

9 Frequency-domain Identification in \mathcal{H}_∞

József Bokor, Zoltan Szabó 235

9.1 Introduction 235

9.1.1 Basic Notation and Definitions 238

9.2 Approximate Linear Models Generated by Discrete φ -Summation . 240

9.3 Approximate Modelling Using Rational Orthogonal Bases 245

9.3.1 Summation Theorems for Rational Expansions 245

9.3.2 The Conditional Expectations E_d 247

9.3.3 Discrete φ -Summation for Rational Expansions 249

9.3.4 Optimal Non-linear Rational Approximation 250

9.3.5 Computational Algorithm 252

9.3.6 Robust Approximation Using Disc Algebra Basis and
Wavelets 253

9.3.7 An Application Example – The MIT Interferometer
Testbed 261

9.4 Conclusions 267

10 Design Issues

Peter Heuberger 269

10.1 Introduction 269

10.2 Choice of Basis Functions 269

10.3 Finite Data Considerations 272

10.3.1 Pole Locations and Number of Functions 272

10.3.2 Initial Conditions 277

10.3.3 Static-gain Enforcement 282

10.3.4 Time Delays 284

10.4 Iterative Scheme 286

10.5 MIMO Models 289

10.5.1 Scalar Basis Functions 289

10.5.2 Multi-variable Basis Functions 290

10.5.3 Discussion 295

10.6 Summary 296

11 Pole Selection in GOBF Models

Tomás Oliveira e Silva 297

11.1 Introduction 297

11.1.1 Pole Parameterizations 301

11.1.2 The Nominal Model Used in All Numerical Examples ... 304

11.2 Asymptotically Optimal Pole Locations 304

11.2.1 The Decay Rates of $\|\varepsilon_y(\cdot; n)\|$ and $\|\varepsilon_g(\cdot; n)\|$ 305

11.2.2 The Decay Rate of $\|\varepsilon_g(\cdot; n)\|$ when $G_0(z)$ Is Rational ... 306

11.2.3 Minimization of ρ for the Laguerre Model 308

11.2.4 Minimization of ρ for the GOBF Model with $n_b > 1$ 311

11.2.5 A Kolmogorov n -Width Interpretation of $\rho(\gamma)$ 313

11.3 Optimal Pole Location Conditions 315

11.3.1 Optimal Pole Conditions for the Laguerre Model 317

11.3.2 Optimal Pole Conditions for the Two-parameter Kautz
Model 325

11.3.3 Optimal Pole Conditions for the General GOBF Model .. 326

11.4 Notes 330

11.5 Summary 331

11.6 Appendix 332

12 Transformation Theory

Peter Heuberger, Thomas de Hoog 337

12.1 Introduction 337

12.2 Preliminaries 337

 12.2.1 Dual Bases 338

 12.2.2 Extension to L_2 340

 12.2.3 Hankel Framework 341

 12.2.4 Products of Basis Functions 342

12.3 Signal and Operator Transforms 342

12.4 Hambo Transform Expressions 347

 12.4.1 Hankel Operator Expressions 349

 12.4.2 Minimal State Space Expressions 350

12.5 Hambo Transform Properties 354

 12.5.1 Poles and Zeros 354

 12.5.2 Norms 354

12.6 Extension to Unstable Systems 355

 12.6.1 Problem Systems 355

12.7 Transformations Based on Takenaka-Malmquist Functions 356

12.8 Transformations of Multi-variable Systems 356

 12.8.1 Approach 1: Orthonormal Basis Functions Using a
 Scalar Inner Function 357

 12.8.2 Approach 2: Orthonormal Basis Functions Using a
 Multi-variable Inner Function 357

12.9 Summary 358

13 Realization Theory

Peter Heuberger, Thomas de Hoog 359

13.1 Introduction 359

13.2 From Expansion Coefficients to Markov Parameters 362

13.3 Realization Algorithms 363

 13.3.1 Algorithm 1: $\mathbf{N} = \infty$ 364

 13.3.2 Algorithm 2: $\mathbf{N} < \infty$, Known McMillan Degree 364

 13.3.3 Algorithm 3: $\mathbf{N} < \infty$, Unknown McMillan Degree 365

13.4 Approximate Realization 366

13.5 Interpolation 368

13.6 Examples 369

 13.6.1 Exact Realization 369

 13.6.2 Approximate Realization, Using Algorithm 2 371

 13.6.3 Approximate Realization, Using Algorithm 3 372

13.7 Summary 373
