## Introduction

1 Some Riemannian Geometry

1.1 Preliminaries 

1.1.1 Moving frames and the first structure equations

1.1.2 Covariant derivative of tensor fields

1.1.3 Meaning of the first structure equations

1.1.4 Curvature: the second structure equations

1.1.5 Einstein manifolds and Schur’s Theorem

1.2 Comparison theorems

1.2.1 Ricci identities

1.2.2 Cut locus and regularity of the distance function

1.2.3 The Laplacian comparison theorem

1.2.4 The Bishop-Gromov comparison theorem

1.2.5 The Hessian comparison theorem

1.3 Some formulas for immersed submanifolds

2 Pointwise conformal metrics

2.1 The Yamabe equation

2.1.1 The derivation of the Yamabe equation

2.1.2 The Kazdan-Warner obstruction

2.1.3 The Weyl and Cotton tensors

2.2 Some applications in the compact case

2.2.1 A rigidity result of Obata

2.2.2 A result by M. F. Bidaut-Véron and L. Véron

2.2.3 A version of Theorem 2.12 on manifolds with boundary

2.2.4 A rigidity result of Escobar

3 General nonexistence results

3.1 Some spectral considerations

3.1.1 The main nonexistence result

3.2 The endpoint case $K = -1$ and the Poisson equation
### A priori estimates
- 4.1 Estimates from below .................................. 105
- 4.2 Estimates from above .................................. 111
- 4.3 Sharpness of the previous results ...................... 115
- 4.4 Some further estimates .................................. 117
- 4.5 Nonexistence results for the Yamabe problem .......... 121

### Uniqueness
- 5.1 A sharp integral condition .............................. 127
- 5.2 A remark on the asymptotic behaviour of solutions: examples in \( \mathbb{R}^m \) and \( \mathbb{H}^m \) .......................... 130
- 5.3 Uniqueness via the weak maximum principle .......... 132
  - 5.3.1 A useful form of the weak maximum principle .... 133
  - 5.3.2 A comparison result .................................. 140
  - 5.3.3 Uniqueness of ground states ......................... 143
- 5.4 Some geometric applications and further uniqueness 146
  - 5.4.1 Conformal diffeomorphisms ......................... 146
  - 5.4.2 Uniqueness for the Yamabe problem ................ 148
  - 5.4.3 An \( L^\infty \) a priori estimate .................... 149

### Existence
- 6.1 A general procedure .................................... 157
  - 6.1.1 Another comparison result .......................... 158
  - 6.1.2 More basic spectral theory and a result of Li, Tam and Yang 158
  - 6.1.3 Two useful lemmas .................................. 162
  - 6.1.4 Existence of a maximal solution .................... 165
- 6.2 Subsolutions and existence .............................. 166
  - 6.2.1 Existence with \( \lambda_1^p(M) < 0 \) .................. 166
  - 6.2.2 \( \lambda_1^p(M) < 0 \): some sufficient conditions ... 170
  - 6.2.3 A more general case .................................. 177
- 6.3 Global sub- and supersolutions ......................... 180
- 6.4 The case of the Yamabe problem ....................... 188
- 6.5 Appendix: the Monotone Iteration Scheme .............. 191

### Some special cases
- 7.1 A nonexistence result ................................... 197
  - 7.1.1 A Rellich-Pohozaev formula ........................ 207
  - 7.1.2 A nonexistence result for hyperbolic space ......... 211
  - 7.1.3 An integral obstruction ............................. 219
- 7.2 Special symmetries and existence ...................... 221
- 7.3 The case of Euclidean space and further results ....... 227
  - 7.3.1 A linear comparison result .......................... 227
Yamabe-type Equations on Complete, Noncompact Manifolds
Mastrolia, P.; Rigoli, M.; Setti, A.G.
2012, VIII, 260 p., Hardcover
ISBN: 978-3-0348-0375-5
A product of Birkhäuser Basel
