Part I Design Techniques

1 State-Dependent Sampling for Online Control	3
Christophe Fiter, Laurentiu Hetel, Wilfrid Perruquetti and Jean-Pierre Richard	
1.1 Introduction	4
1.2 Problem Statement	5
1.2.1 System Description	5
1.2.2 Objectives	5
1.3 Main Stability Result	6
1.4 Self-Triggered Controller Design	7
1.4.1 Convex Embedding Design Based on Taylor Polynomials	8
1.4.2 Design of the Sampling Function τ for Given Parameters	9
1.4.3 Optimization of the Parameters (Maximization of the Lower-Bound τ^* of the Sampling Function)	10
1.5 Numerical Example	11
1.5.1 Simulation Results	11
1.5.2 Advantages of the Sampling Function's Lower-Bound Optimization	12
1.6 Conclusion.	13
Appendix	13
References	16
2 Design of First Order Controllers for Unstable Infinite Dimensional Plants	17
Hitay Özbay and A. Nazlı Gündes	
2.1 Introduction	17
2.2 Problem Definition and Examples of Plants Considered	18
2.3 A Sufficient Condition for Feedback System Stability.	20

2.4	PD and PI Controller Designs	23
2.4.1	PD Controller Design	23
2.4.2	PI Controller Design	26
2.5	Conclusions and Future Extensions	28
	References	29
3	Anti-Windup Conditioning for Actuator Saturation in Internal Model Control with Delays	31
	Pavel Zítek, Jaroslav Bušek and Tomáš Vyhlídal	
3.1	Introduction	31
3.2	Dimensionless Model of the Considered Plant	33
3.2.1	Identification of the Plant Model with a Given Step Response	33
3.3	Internal Model Controller Design	34
3.4	Utilizing the Ultimate Frequency in the IMC Design	37
3.5	Windup-Observer Conditioning for the IMC Controller.	39
3.6	Tuning the Windup Observer to Optimize the Control Loop Response.	40
3.7	Application Example and the Tuning Rule	41
3.8	Concluding Remarks	44
	References	44
4	Stabilization of Some Fractional Neutral Delay Systems Which Possibly Possess an Infinite Number of Unstable Poles	47
	Le Ha Vy Nguyen and Catherine Bonnet	
4.1	Introduction	47
4.2	Stabilizability Properties of Fractional Systems with Commensurate Delays	48
4.3	Parametrization of the Set of Stabilizing Controllers in a Particular Case.	51
4.4	Conclusion.	59
	References	59
5	Controller Design for a Class of Delayed and Constrained Systems: Application to Supply Chains	61
	Charifa Moussaoui, Rosa Abbou and Jean Jacques Loiseau	
5.1	Introduction	61
5.2	Problem Statement: Inventory and Production Control	63
5.3	System Control Structure.	65
5.3.1	Order Rates and Control Structure	65
5.3.2	The Closed-Loop System Dynamics	66
5.3.3	Admissible Initial Conditions.	67
5.4	Controller Designing Issues	67
5.5	Generalization for N-Stages Supply Chain.	70

5.6	Simulation Example and Discussions	71
5.7	Conclusion and Perspectives	73
	References	74
6	Delay Effects in Visual Tracking Problems for an Optronic Sighting System	77
	Alban Quadrat and Arnaud Quadrat	
6.1	Automatic Visual Tracker	77
6.2	Parametrizations of all Stabilizing Controllers	80
6.3	Study of the Tracking Problem and Numerical Simulations	88
	References	91
 Part II Numerical Methods		
7	Tuning an H-Infinity Controller with a Given Order and a Structure for Interconnected Systems with Delays	95
	Suat Gumussoy and Wim Michiels	
7.1	Introduction	95
7.2	Motivating Examples	98
7.3	Transfer Functions	99
7.4	The Strong H-Infinity Norm of Time-Delay Systems	100
7.5	Computation of Strong H-Infinity Norms	104
7.6	Fixed-Order H-Infinity Controller Design	105
7.7	Strong Stability, Fixed-Order Stabilization and Robust Stability Margin Optimization	106
7.8	Illustration of the Software	107
	References	109
8	Delay-Independent Stability Via Reset Loops	111
	Alfonso Baños, Félix Pérez Rubio, Sophie Tarbouriech and Luca Zaccarian	
8.1	Introduction	112
8.2	Problem Data and Standing Assumption	113
8.3	Hybrid Closed-Loop System	115
8.4	Stability Properties of the Reset Control Scheme	118
	8.4.1 A Lyapunov-Krasovskii Theorem	118
	8.4.2 Main Stability Result	119
8.5	Simulation Example	121
	References	124

**9 Low Complexity Invariant Sets for Time-Delay Systems:
A Set Factorization Approach. 127**
 Sorin Olaru, Nikola Stanković, Georges Bitsoris
 and Silviu-Iulian Niculescu

9.1 Introduction 127

9.2 Basic Set Invariance Notions in Control 128

9.3 Time-Delay Systems and Associated Invariant Sets 130

9.3.1 Dynamics Described by Discrete-Time
 Delay-Difference Equation. 130

9.3.2 Set Invariance for Time-Delay Systems. 131

9.3.3 Positive Invariance and the Control Law Design 132

9.4 Set Factorization. 133

9.5 The Factorization Aspect of Set-Invariance 134

9.6 Example of Factorization via Non-Minimal State
 Representation 137

9.7 Conclusions 138

References 139

**10 Delays and Propagation: Control Liapunov Functionals
 and Computational Issues 141**
 Daniela Danciu and Vladimir Răsvan

10.1 Motivating Applications and the Definition
 of a Class of Models. 141

10.2 Energy Identity. Liapunov Functional. Controller Synthesis. 144

10.3 The Closed-Loop System and its Qualitative Properties 146

10.4 Numerical Approach and Simulation. 147

10.4.1 Applying the Method of Lines 147

10.4.2 Implementation Using the CNNs’ Paradigm. 149

10.4.3 Simulation Results 150

10.5 Some Conclusions and Open Problems 152

References 154

**11 Integral Inequality for Time-Varying Delay Systems
 and Its Application to Output-Feedback Control 155**
 Alexandre Seuret and Frédéric Gouaisbaut

11.1 Introduction 155

11.2 Some Relevant Inequalities 157

11.2.1 Improved Integral Inequality 157

11.2.2 Improved Reciprocally Convex
 Combination Inequality 159

11.3 Stability Analysis of Time-Varying Delay Systems. 161

11.3.1 Stability Analysis Based on Jensen’s Inequality 162

11.3.2 Stability Analysis Based on the New
 Integral Inequality 164

11.4 Example	166
11.5 Conclusions	168
References	168

Part III Applications

12 Control-Oriented Input-Delay Model of the Distributed Temperature of a SI Engine Exhaust Catalyst	173
Delphine Bresch-Pietri, Thomas Leroy and Nicolas Petit	
12.1 Introduction	173
12.2 Experimental Set-Up	175
12.3 Partial Differential Equation Model	177
12.4 Approaching the Dynamics by an Input-Delay Ordinary Differential Equation.	179
12.4.1 Operational Calculus without Source Term	179
12.4.2 Including Chemical Reactions Energy	182
12.4.3 Validation of the Proposed Model on Experimental Data	184
12.5 Conclusion.	186
Appendix	186
References	187
13 Suppressing Stick-Slip Oscillations in Oilwell Drillstrings	189
Belem Saldivar, Sabine Mondié and Alexandre Seuret	
13.1 Introduction	190
13.2 Drilling System Modeling	191
13.2.1 Distributed Parameter Model	191
13.2.2 Neutral-Type Time-Delay Model	192
13.2.3 Stick-Slip Phenomenon	193
13.3 Control Design to Suppress the Stick-Slip Phenomenon	194
13.3.1 Wave Equation Approach	194
13.3.2 Polytopic Approximation Approach	196
13.4 Conclusion.	202
References	203
14 Flatness-Based Control for a Non-Linear Spatially Distributed Model of a Drilling System	205
Torsten Knüppel, Frank Woittennek, Islam Boussaada, Hugues Mounier and Silviu-Iulian Niculescu	
14.1 Introduction	205
14.2 Model of a Drill String	206

14.3	Flatness of the Drill String Model	208
14.3.1	Flatness of the Axial Subsystem.	209
14.3.2	Flatness of the Entire System.	210
14.4	Flatness-Based Control Design.	211
14.4.1	Open-Loop Control.	211
14.4.2	Feedback Control	211
14.5	Prediction of Boundary Values.	213
14.6	Numerical Simulation	214
14.7	Conclusion and Outlook	217
	References	218
15	Smith Predictor-Based Control with Distance Feedback for Haptic Systems Under Distributed Time-Delays	219
	Bogdan Liacu, Irinel-Constantin Morărescu, Silviu-Iulian Niculescu, Claude Andriot, Didier Dumur, Frédéric Colledani and Patrick Boucher	
15.1	Introduction	220
15.2	Theoretical Background.	221
15.3	Distributed Delays	223
15.4	Smith Predictor with Distance Feedback	228
15.5	Experimental Validation	229
15.6	Concluding Remarks	233
	References	234
	Index	237
