## 1 Historical Introduction: The Telescope and Its Remarkable Contribution to Scientific Discovery

1. Historical Introduction: The Telescope and Its Remarkable Contribution to Scientific Discovery .......................... 1

## 2 Introduction

1. Kolmogorov Theory ........................................ 15
2. Alternative Theoretical Approach .......................... 24
3. Caution Regarding Quantities and Functions Used to Create Illustrative Plots and Figures .......................... 29
4. Caution Regarding Quantities and Functions Used to Create Illustrative Plots and Figures .......................... 30
5. References .................................................. 32

## 3 Terms, Definitions, and Theoretical Foundations

1. Air Refractive Index ........................................ 33
2. Point-Objects ............................................. 46
3. The Electromagnetic Spectrum ................................ 46
4. Quasi-monochromatic Light .................................. 48
5. Amplitude and Phase of Light Waves Disrupted by Turbulence .................................................. 48
6. The Atmosphere Considered as a Stochastic Process ..... 50
7. Spatial and Temporal Stationarity and the Ensemble Average .......................... 51

### 3.1 Air Refractive Index

1. Air Refractive Index ........................................ 34
2. Air Temperature and Altitude ................................ 35
3. Air Pressure and Altitude .................................... 35
4. Integrated Optical Path Difference Over the Entire Atmospheric Depth .......................................... 37
5. Effect of Humidity ........................................... 38
6. Effect of Dispersion .......................................... 38
7. Random Variables Associated with Atmospheric Turbulence .................................................. 39
8. Astronomical Refraction ....................................... 42
9. Atmospheric Extinction ....................................... 44

### 3.2 Point-Objects

1. Point-Objects ............................................. 46

### 3.3 The Electromagnetic Spectrum

1. The Electromagnetic Spectrum ................................ 46

### 3.4 Quasi-monochromatic Light

1. Quasi-monochromatic Light .................................. 48

### 3.5 Amplitude and Phase of Light Waves Disrupted by Turbulence

1. Amplitude and Phase of Light Waves Disrupted by Turbulence .................................................. 48

### 3.6 The Atmosphere Considered as a Stochastic Process

1. The Atmosphere Considered as a Stochastic Process ........................................................................... 50
2. Spatial and Temporal Stationarity and the Ensemble Average .......................... 51
3.6.2 Standard Error and Standard Deviation .......................... 52
3.6.3 Autocovariance and Autocorrelation Functions, the Variance, and rms .................................................. 52
3.6.4 The Atmospheric Refractive Index Field ....................... 53

3.7 Scalar Diffraction Theory ........................................... 54
3.7.1 Scalar Diffraction Theory Applied to Atmospheric Propagation ............................................................. 55
3.7.2 Scalar Diffraction Theory Applied to Telescope Imaging ............................................................... 55
3.7.3 Monochromatic Light Fields ...................................... 56
3.7.4 Analytic Signal ....................................................... 57
3.7.5 Complex Amplitude .................................................. 57
3.7.6 Intensity ............................................................... 58
3.7.7 Irradiance ............................................................. 58
3.7.8 Polychromatic Light Fields ....................................... 59

3.8 Coherence Terminology ................................................. 59

3.9 Free-Space Propagation .................................................. 60
3.9.1 Maxwell’s Electromagnetic Wave Equations ................ 61
3.9.2 Helmholtz Equation .................................................. 63
3.9.3 Solutions for Infinitely Extensive Plane Waves ......... 63

3.10 Mathematical Notations and Quantity Dimensions .......... 64

References ........................................................................... 66

4 Diffraction ................................................................. 67
4.1 Diffraction by an Aperture ............................................. 68
4.1.1 Fresnel Number ....................................................... 69
4.1.2 Fresnel–Kirchhoff Diffraction Formula ...................... 70
4.1.3 Fresnel Near-Field Diffraction .................................. 71
4.1.4 Stationary Phase ...................................................... 72
4.1.5 Fraunhofer Far-Field Diffraction ............................... 73

4.2 Optical System Terminology .......................................... 74
4.2.1 Telescopes, Telescope Objectives, and Eyepieces ....... 74
4.2.2 Aperture Stops, Pupils, Conjugate Distances, Focal Lengths, and F/Numbers ................................................. 76
4.2.3 Light Rays and Ray Terminology ............................... 77
4.2.4 Objects at Finite Distances ....................................... 78
4.2.5 Objects at Infinite Distances ..................................... 79
4.2.6 Pupil Functions ....................................................... 79

4.3 The Amplitude Point Spread Function ........................... 81
4.3.1 For Diffraction-Limited Telescopes with Circular Apertures ................................................................. 81

4.4 The Intensity Point Spread Function ............................... 82
4.4.1 The Airy Pattern ...................................................... 82
4.5 Strehl Intensity ................................................. 83
4.5.1 Expressed in Terms of rms Wavefront Error .......... 84
4.5.2 For Circularly Symmetric Images ....................... 84
4.6 Rayleigh Resolution Criterion ............................... 85
4.7 Images of Extended Objects ................................. 86
4.7.1 Superposition Property .................................. 86
4.7.2 Nonlinear Optical Phenomena ........................... 86
4.7.3 Isoplanaticity .............................................. 87
4.7.4 Convolution Integrals .................................... 87
4.7.5 Images of Coherently Illuminated
         Extended Objects ........................................ 88
4.7.6 Images of Incoherently Illuminated
         Extended Objects ........................................ 89
4.7.7 Images of Partially Coherently Illuminated
         Extended Objects ........................................ 89
4.8 Images of Two-Point Objects ............................... 89
4.8.1 Incoherently Illuminated Two-Point Objects .......... 91
4.8.2 Coherently Illuminated Two-Point Objects ............. 91
4.9 Stellar Speckle Patterns .................................... 92
4.10 Effect of Central Obstruction on Telescope Point
     Spread Functions ........................................... 93
4.11 Mathematical Notation Used in This Chapter ............ 94
References ......................................................... 95

5 Wave Propagation After Scattering by a Thin
  Atmospheric Layer ............................................. 97
  5.1 Characterizing Atmospheric Paths and Telescopes
      by MTFs and OTFs ....................................... 99
  5.2 The Atmospheric Refractive Index ........................ 100
  5.3 Wave Propagation in the Geometrical Optics Region .... 100
      5.3.1 Optical Path Difference ........................... 101
      5.3.2 Phase Angle of the Exiting Wave ................. 102
      5.3.3 Complex Amplitude of the Exiting Wave .......... 103
      5.3.4 The Two-Point Two-Wavelength Correlation
            Function for Exiting Waves ...................... 104
      5.3.5 Complex Coherence Factor for Exiting Waves ...... 105
      5.3.6 Illustrative Plots of the Complex
            Coherence Factor .................................. 106
      5.3.7 Illustrative Plots of the Two-Point
            Two-Wavelength Correlation Function ............. 107
  5.4 Near-Field Propagation of the Complex Amplitude ....... 108
5.5 Near-Field Propagation of the Two-Point Two-Wavelength Correlation Function ........................................... 109
5.5.1 Cases Where the Function Conserves ................. 111
5.5.2 General Case of Non-conservation of the Function .................................................. 113
5.6 Near-Field Propagation of the Complex Coherence Factor ... 116
5.7 Development of Scintillation After Light Scattering by a Thin Layer ........................................... 117
5.7.1 Dependence of Scintillation on Turbulence Scale Sizes in the Layer ................................. 117
5.7.2 Dependence of Scintillation on the Various Controlling Parameters .............. 120
5.7.3 Effective Fresnel Numbers for Atmospheric Paths ........................................... 123
5.8 Mathematical Notation Used in This Chapter .......... 128
References ............................................................................. 129

6 Wave Propagation Over Extended Atmospheric Paths ........ 131
6.1 Atmospheric MTF Expressions Developed by Hufnagel and Stanley ........................................... 133
6.1.1 Hufnagel and Stanley’s General Expression for the Atmospheric MTF ........................................... 134
6.1.2 Hufnagel and Stanley’s Kolmogorov-Based Expression for the Atmospheric MTF ........................................... 135
6.2 Layered Model Representations of Extended Atmospheric Paths ........................................... 143
6.2.1 Two Equivalent Random Phase Screen Atmospheric Path Models ........................................... 146
6.2.2 Properties of the Phase Screens in the Uncorrelated Random Phase Screen Path Model ........................................... 151
6.2.3 Effect of Individual Random Phase Screens on Transmitted Light Waves ........................................... 157
6.3 General Expression for the Two-Point Two-Wavelength Correlation Function ........................................... 157
6.3.1 Case of Isotropic Turbulence ........................................... 163
6.3.2 The Functional Form When $\rho(\xi, \eta)$ Is Gaussian ........................................... 163
6.4 General Expression for the Atmospheric MTF ........................................... 165
6.4.1 Case of Isotropic Turbulence ........................................... 165
6.4.2 Functional Forms When $\rho(\xi, \eta)$ Is Gaussian ........................................... 165
6.4.3 Comparison of the General Expression to that of Hufnagel and Stanley ........................................... 166
7.8.3 Two-Wavelength Correlation Function of the Intensity at a Single Point in the Image .... 195
7.8.4 Two-Wavelength Correlation Function of the Complex Amplitude at a Single Point in the Image ................. 196
7.9 OTF for an Entire End-to-End Imaging Path .................. 198
7.10 OTF for an Entire End-to-End Imaging Path for Space Telescopes ........................................ 198
7.10.1 OTF and Intensity PSF for a Diffraction-Limited Telescope with Circular Aperture .......... 199
7.11 Mathematical Notation Used in This Chapter ................ 199

8 Atmospheric Path Characterization ................. 201
8.1 Obtaining the Atmospheric MTF from a Point-Object Image .................................................. 203
8.1.1 For the Case of a Large Diffraction-Limited Telescope .................................................. 203
8.1.2 Long- and Short-Exposure Atmospheric MTFs ........ 204
8.1.3 Effective End-to-End OTF for a Telescope Equipped with Adaptive Optics .......... 205
8.1.4 Atmospheric MTF Plots and Corresponding Intensity Envelopes ........................................ 206
8.2 Measurement of the rms OPD Fluctuation ............... 206
8.2.1 Measurement for the Case $\sigma/\lambda \geq 0.4$ Using Two Narrowband Filters .......... 206
8.2.2 Measurement for the Case $\sigma/\lambda \geq 0.4$ Using a Broadband Filter .......... 209
8.2.3 Actual Field Measurements of $\sigma$ ............. 213
8.2.4 Influence of Telescope Aberrations on the Measured $\sigma$ Values .................. 216
8.2.5 Convergence of $\sigma$ as $\lambda_2 \rightarrow \lambda_1$ .......... 216
8.2.6 Measurement of $\sigma$ for the Case $\sigma/\lambda < 0.4$ ........ 217
8.2.7 Measurement of Residual OPD Fluctuation for an AO-Equipped Telescope .......... 218
8.2.8 Dependence of $\sigma$ on Zenith Angle .............. 219
8.3 Obtaining the Autocorrelation Function of the OPD Fluctuation ................. 219
8.3.1 Obtaining the Function for an AO-equipped Telescope .......... 221
8.3.2 Significance of the Average Turbulence Structure Size .......... 221
8.3.3 Path Characterization During Daytime .............. 224
8.4 The Wavefront Structure Function ........................................... 224
  8.4.1 Wavefront Structure Function for Isotropic Turbulence .......... 224
  8.4.2 Wavefront Structure Function for AO-Equipped Telescopes .......... 225
8.5 Refractive Index Structure Function ........................................ 225
  8.5.1 Refractive Index Structure Function for Isotropic Turbulence .......... 226
8.6 Power Spectral Density of the Turbulence Structure ......................... 227
  8.6.1 Power Spectral Density for Isotropic Turbulence .......... 227
  8.6.2 Power Spectrum of Residual OPD Fluctuation for AO-Equipped Telescopes .......... 228
  8.6.3 Volume Contained Under the Power Spectrum ......................... 229
8.7 Mathematical Notation Used in This Chapter ................................ 230

9 The Average Intensity Envelope of an Unresolved Star Image .......... 233
  9.1 Average Intensity Envelope for the Image of an Unresolved Star .......... 235
  9.2 Average Envelope for a Diffraction-Limited Telescope with Circular Aperture .......... 236
    9.2.1 Case of Isotropic Turbulence ........................................ 236
  9.3 Average Envelopes for Small Diffraction-Limited Telescopes with Circular Apertures .......... 237
  9.4 Seeing Disk Envelopes Formed by Large Telescopes ...................... 238
    9.4.1 Case (1): Speckle Images for the Case $\sigma/\lambda \geq 0.4$ .......... 239
    9.4.2 Case (2): Core and Halo Images for the Case $\sigma/\lambda < 0.4$ .......... 242
  9.5 Mathematical Notation Used in This Chapter ................................ 245

10 Core and Halo Star Images Formed by Large Telescopes .................... 247
  10.1 Core and Halo Image Structure .......................................... 249
    10.1.1 Core Strength .................................................. 250
    10.1.2 Core Shape .................................................. 250
    10.1.3 Halo Strength .................................................. 251
    10.1.4 Halo Shape .................................................. 251
    10.1.5 Characteristics of Core and Halo Images .......................... 252
  10.2 Circularly Symmetric Core and Halo Image Envelopes Formed by Large Telescopes .......... 254
    10.2.1 Circularly Symmetric Telescope Point-Spread Functions .................. 255
10.2.2 Normalization of 10.8
10.2.3 Numerical Accuracy of 10.8
10.3 Theoretical and Observed Core and Halo Structure
  10.3.1 Core Dependence on Wavelength
  10.3.2 Core Dependence on Seeing
  10.3.3 Core Dependence on Telescope Size
  10.3.4 Core Dependence on Telescope Aberrations
  10.3.5 Image Cores Obtained in the Near-IR by the 4-m Mayall Telescope
10.4 The Optimum Wavelength
10.5 Irradiance at Image Center as a Function of Wavelength
10.6 Effect of Telescope Aberrations on Image Cores
  10.6.1 The Effect on Irradiance at Core Center
  10.6.2 The Effect on the Optimum Wavelength
10.7 Instantaneous Core Location for Diffraction-Limited Telescopes
  10.7.1 Angular Jitter of the Image Centroid
  10.7.2 Instantaneous Core Location for Telescopes with Rectangular Apertures
  10.7.3 Instantaneous Core Location for Telescopes with Square Apertures
  10.7.4 Variance of Core Excursions for Rectangular Aperture Telescopes
  10.7.5 rms Core Excursions for Rectangular Aperture Telescopes
  10.7.6 rms Core Excursions for Telescopes with Circular Apertures
10.8 Griffin’s Naked-Eye Core Observations
10.9 Cores at Near-IR Wavelengths
10.10 Adaptive Optics
  10.10.1 Tip–Tilt Correction
  10.10.2 Active Optics
  10.10.3 Laser Guide Stars
10.11 Speckle Imaging
  10.11.1 Lucky Imaging
  10.11.2 Speckle Interferometry
10.12 Mathematical Notation Used in This Chapter

14 Telescope Resolution and Optical Tolerance Specifications ............... 405
14.1 Telescope Resolution Criteria ............................................................. 409
14.1.1 Rayleigh Criterion ................................................................. 409
14.1.2 Dawes Criterion ................................................................. 409
14.1.3 Sparrow Criterion ................................................................. 410
14.2 Effect of Central Obstruction on Resolution ................................................................................. 411
14.3 Effect of Mild Aberrations on Resolution ......................................................................................... 413
14.4 Resolution Given by Gaussian Approximation of the Airy Pattern ...................................................... 413
14.5 Resolution from Images Displaying Core and Halo Structure .............................................................. 414
14.5.1 Calculating the Just-Resolved Separation ......................................................................................... 416
14.5.2 Just-Resolved Separation for Core-Dominated Images ..................................................................... 418
14.5.3 Just-Resolved Separation for Halo-Dominated Images ..................................................................... 418
14.5.4 Relative Angular Widths of Cores and Halos ................................................................................. 419
14.6 Resolution of AO-Equipped Telescopes
14.6.1 Halo-Dominated Images
14.6.2 Emergence of Cores in AO-Corrected Images
14.6.3 Strehl Intensity Limit Imposed by Uncorrected Scintillation
14.7 Irradiance in Center of Star Images Formed by Large Telescopes
14.7.1 Telescope Resolution and the Intensity in Center of a Star Image
14.7.2 Diffraction-Limited Imaging and Imaging at the Optimum Wavelength
14.8 Optical Tolerances for Large Ground-Based Telescopes
14.8.1 Optical Tolerances for Resolving Image Cores
14.8.2 Stability of Multiple-Segment Primary Mirrors
14.9 Defocus Tolerances for Large Telescopes
14.9.1 Allowance for Delivering Diffraction-Limited Image Cores
14.9.2 Allowance for Delivering Substantially Ideal Halo-Only Images
14.9.3 Ratio of Depth of Focus Allowances for Resolving Cores and Halos
14.10 Resolution Obtained by the Keck 10-m Telescopes
14.10.1 Obtaining Diffraction-Limited Images at Visible Wavelengths
14.11 Resolution Possibilities with Future ELT Instruments
14.12 Apparent Star Size and Its Dependence on Star Brightness
14.12.1 Use of Binary Stars to Estimate Limiting Detectable Magnitude
14.13 Resolution Obtained from Speckle Imaging
14.13.1 The Star Test
14.13.2 Optical Transfer Function Tests
14.13.3 Interferometric Tests
14.13.4 The Hartmann Wavefront Test
14.14 Mathematical Notation Used in This Chapter

15 Laboratory Simulation of Images Formed by Large Telescopes
15.1 Choice of Detector in the Optical Simulator
15.2 Choice of Scale Factors in the Optical Simulator
15.2.1 Scaling Equations for Image Simulation at the Same Wavelength ................. 469
15.2.2 Scaling When the Images Are Simulated at a Different Wavelength .......... 474
15.3 Extended Incoherent Illumination and Image Simulation ...................... 477
15.3.1 Incoherent and Partially Coherent Illumination ............................... 478
15.4 Space Shuttle Image Simulations ....................................................... 484
15.4.1 Parameter Values Used for Simulating the Space Shuttle Images ............ 485
15.5 Practical Aspects of Illumination Used in Optical Simulators ................. 487
15.6 Simulating Images of Actively Illuminated Targets .............................. 489
15.6.1 Illumination and Imaging of Actively Illuminated Targets ................. 490
15.6.2 Additional Scaling Requirements When Active Illumination Is Used ........ 492
15.6.3 Simulation of Speckle Reduction Mechanisms .................................. 492
15.7 Mathematical Notation Used in This Chapter ..................................... 510
