## Contents

1 **Introduction** ........................................ 1  
References .................................................. 6  

2 **Introduction to the Vertical Derivatives of Horizontal Stress (VDoHS) Rates** ...................................... 9  
2.1 Flat Earth Form of the Force Balance Equations at the Earth’s Surface ............................ 9  
2.2 1-D Expressions ........................................ 12  
2.3 Structure of 2-D Expressions ............................ 13  
2.4 Spherical Polar Coordinate Form of the Force Balance Equations at the Earth’s Surface .......... 14  
2.5 Summary and Discussion. ............................... 17  
References .................................................. 18  

3 **Inversion Methodology** ................................ 19  
3.1 Summary of the Inversion Process .................... 19  
3.2 1-D Basis Functions .................................... 22  
3.3 Interpolation Related Issues and 2-D Basis Functions .................................................. 26  
3.4 Boundary Conditions and Finite Element Solutions for 2-D Problems ................................ 27  
3.5 Application of the Maximum Entropy Principle .................................................. 29  
3.6 Linking Maximum Entropy to Bayesian Inversion .................................................. 35  
3.7 Obtaining Expected Values for $\|m\|^2$ and $\|\nabla m\|^2$ .................................. 38  
3.8 Appraisal of Inversion Solutions ........................ 41  
3.9 Inclusion of Radial Velocity in the Spherical Case .................................................. 41  
3.10 Summary and Discussion. ............................... 43  
References .................................................. 43
4 1-Dimensional Synthetic Examples

4.1 Forward Examples for Strike-Slip and Dip-Slip Faults

4.2 Obtaining Fault Characteristics from Strain and VDoHS Rates

4.3 Effects of Discrete Sampling Illustrated for a Regular Sample Spacing

4.4 Inversions of Randomly Generated Datasets

4.5 Effects of Random Noise on Inversion Results

4.6 Effect of Near Surface Heterogeneity

4.7 Summary and Discussion

References

5 Application to Central South Island, New Zealand

5.1 Tectonic Setting and 1-D Inversion Results

5.2 Estimation of Alpine Fault Properties

5.3 Other Sources of Deformation

5.4 Model Appraisal

5.5 Summary and Discussion

References

6 2-Dimensional Examples

6.1 2-Dimensional Synthetic Examples of Strike-Slip and Dip-Slip Faults and a Mogi Source

6.2 2-Dimensional Inversions of Randomly Generated Datasets

6.3 2-D Inversion Results

6.4 Summary and Discussion

References

7 Concluding Remarks
