Part I Introduction

1	Background and Motivation	3
1.1	Phenomenology	3
1.2	Condensation and magnetisation: from gases to ferromagnets	5
1.3	Historical perspective	7
1.3.1	Early achievements	8
1.3.2	The pathwise approach	10
1.3.3	The spectral approach	11
1.3.4	The potential-theoretic approach	11
1.3.5	The computational approach	12
2	Aims and Scopes	15
2.1	Two paradigmatic models	16
2.1.1	Kramers model: Brownian motion in a double-well	16
2.1.2	Finite-state Markov processes	17
2.2	Model reduction	19
2.3	Variational point of view	19
2.4	Specific models	20
2.5	Related topics	22

Part II Markov Processes

3	Some Basic Notions from Probability Theory	27
3.1	Probability and measures	27
3.1.1	Probability spaces	27
3.1.2	Random variables	29
3.1.3	Integrals	30
3.1.4	Spaces of integrable functions	32
3.1.5	Convergence	34
3.1.6	Radon-Nikodým derivative	36
3.2	Stochastic processes	37

3.2.1	Definition of stochastic processes	37
3.2.2	The Daniell-Kolmogorov extension theorem	39
3.3	Conditional expectations	40
3.3.1	Definition of conditional expectations	40
3.3.2	Elementary properties of conditional expectations	41
3.3.3	Conditional probability measures	42
3.4	Martingales in discrete time	44
3.4.1	Definitions	44
3.4.2	Upcrossings and convergence	45
3.4.3	Maximum inequalities	46
3.4.4	Stopping times and stopped martingales	49
3.5	Martingales in continuous time	53
3.5.1	Càdlàg functions	53
3.5.2	Filtrations, supermartingales and càdlàg processes	54
3.5.3	The Doob regularity theorem	55
3.5.4	Convergence theorems and martingale inequalities	57
3.5.5	Stopping times	58
3.5.6	First hitting time and first entrance time	59
3.5.7	Optional stopping and optional sampling	60
3.6	Bibliographical notes	61
4	Markov Processes in Discrete Time	63
4.1	Markov processes: main definitions and key facts	63
4.1.1	Definition and elementary properties	63
4.1.2	Markov processes with stationary transition probabilities	66
4.1.3	The strong Markov property	67
4.2	Markov processes and martingales	67
4.2.1	Semigroups	68
4.2.2	The martingale problem	69
4.2.3	Harmonic functions and martingales	71
4.2.4	The Doob transform	72
4.3	Markov processes with countable state space	74
4.4	Bibliographical notes	78
5	Markov Processes in Continuous Time	79
5.1	Markov jump processes	79
5.2	Brownian motion	80
5.2.1	Definition of Brownian motion	81
5.2.2	Martingale and Markov properties	84
5.3	General Markov processes	86
5.3.1	Semigroups and generators	86
5.3.2	Feller-Dynkin processes	89
5.3.3	The strong Markov property	91
5.4	The martingale problem	92
5.4.1	Generators and cores	92
5.4.2	The martingale problem	95

5.4.3	Uniqueness	99
5.4.4	Existence	100
5.5	Itô calculus	102
5.5.1	Square-integrable continuous martingales	102
5.5.2	Stochastic integrals for simple processes	105
5.5.3	Itô formula	107
5.6	Stochastic differential equations	107
5.6.1	Strong solutions	108
5.6.2	Existence and uniqueness of strong solutions	109
5.6.3	The Doob transform	112
5.6.4	The Girsanov theorem	113
5.7	Stochastic partial differential equations	114
5.7.1	The stochastic Allen-Cahn equation	115
5.7.2	Discretisation	119
5.8	Bibliographical notes	122
6	Large Deviations	125
6.1	Large deviation principles	125
6.2	Path large deviations for diffusion processes	129
6.2.1	Brownian motion	129
6.2.2	Brownian motion with drift	134
6.2.3	Diffusion processes	135
6.3	Path large deviations for stochastic partial differential equations	136
6.4	Path large deviations for Markov processes	137
6.5	Freidlin-Wentzell theory	138
6.5.1	Properties of action functionals	138
6.5.2	Crossing and exit problems	139
6.5.3	Metastability	141
6.6	Bibliographical notes	142
7	Potential Theory	145
7.1	The Dirichlet problem: discrete time	145
7.1.1	Definition	145
7.1.2	Green function, equilibrium potential and measure	147
7.1.3	Reversibility	150
7.1.4	One-dimensional nearest-neighbour random walks	155
7.2	The Dirichlet problem: continuous time	157
7.2.1	Definition	157
7.2.2	Countable state space	158
7.2.3	Diffusion processes	159
7.2.4	Reversible Markov processes	161
7.2.5	One-dimensional diffusions	171
7.3	Variational principles	173
7.3.1	The Dirichlet principle	174
7.3.2	The Thomson principle	175
7.3.3	The Berman-Konsowa principle	178

- 7.4 Variational principles in the non-reversible setting 181
- 7.5 Bibliographical notes 184

Part III Metastability

- 8 Key Definitions and Basic Properties 189**
 - 8.1 Characterisation of metastability 189
 - 8.2 Renewal estimates and ultrametricity 192
 - 8.3 Estimates on mean hitting times 195
 - 8.3.1 Rough bounds 195
 - 8.3.2 Sharp bounds 196
 - 8.4 Spectral characterisation of metastability 200
 - 8.4.1 A priori bounds 202
 - 8.4.2 Characterisation of small eigenvalues 203
 - 8.4.3 Computation of small eigenvalues 209
 - 8.4.4 Exponential law of the metastable exit times 220
 - 8.5 Metastability in uncountable state spaces 225
 - 8.6 Bibliographical notes 226
- 9 Basic Techniques 227**
 - 9.1 Capacity estimates 227
 - 9.1.1 General strategies 228
 - 9.1.2 Lower bounds via flows 230
 - 9.2 Coarse-graining 233
 - 9.3 Lumping 234
 - 9.4 Regularity estimates 236
 - 9.4.1 Elliptic regularity theory 236
 - 9.4.2 Coupling methods 240
 - 9.5 Bibliographical notes 242

Part IV Applications: Diffusions with Small Noise

- 10 Discrete Reversible Diffusions 247**
 - 10.1 Definitions 247
 - 10.2 Upper bounds on capacities 251
 - 10.2.1 Cleaning of the Dirichlet form 252
 - 10.2.2 Construction of an approximate harmonic function 254
 - 10.2.3 Final estimate 257
 - 10.3 Lower bounds on capacities 258
 - 10.4 Bibliographical notes 263
- 11 Diffusion Processes with Gradient Drift 265**
 - 11.1 The setting 265
 - 11.2 Capacity estimates and mean hitting times 266
 - 11.2.1 Main results 267
 - 11.2.2 Rough estimates on capacities and harmonic functions 268
 - 11.2.3 Sharp estimates on capacities 270
 - 11.2.4 Metastable exit times and capacities 275

11.3	Spectral theory	278
11.3.1	Main results	279
11.3.2	A priori spectral estimates	281
11.3.3	Principal Dirichlet eigenvalues	284
11.3.4	Exponentially small eigenvalues and their eigenfunctions	289
11.3.5	Improved error estimates	300
11.3.6	Exponential distribution of metastable exit times	302
11.4	Bibliographical notes	302
12	Stochastic Partial Differential Equations	305
12.1	Definitions, main theorem and outline of proof	305
12.2	Approximation properties of the potential	307
12.3	Estimate of the capacity	311
12.3.1	Properties of the potential	311
12.3.2	Upper bound	314
12.3.3	Lower bound	316
12.4	Estimate of the equilibrium potential	317
12.5	Proof of the main theorem	319
12.6	Bibliographical notes	320
Part V Applications: Coarse-Graining in Large Volumes at Positive Temperatures		
13	The Curie-Weiss Model	325
13.1	The Curie-Weiss model	325
13.2	Metastable behaviour	328
13.3	Bibliographical notes	330
14	The Curie-Weiss Model with a Random Magnetic Field: Discrete Distributions	331
14.1	The model	331
14.2	Gibbs measure and order parameter	332
14.3	Glauber dynamics	334
14.4	Coarse-graining	335
14.5	The landscape near critical points	338
14.6	Eigenvalues of the Hessian	340
14.7	Topology of the landscape	341
14.8	Bibliographical notes	344
15	The Curie-Weiss Model with Random Magnetic Field: Continuous Distributions	345
15.1	Main results	345
15.2	Coarse-graining and the mesoscopic approximation	346
15.2.1	Coarse-graining	347
15.2.2	The energy landscape near critical points	348
15.3	Upper bounds on capacities	350
15.4	Lower bounds on capacities	352
15.4.1	Two-scale flows	352

- 15.4.2 Propagation of errors along microscopic paths 356
- 15.5 Estimates on mean hitting times 363
 - 15.5.1 Mean hitting time and equilibrium potential 363
 - 15.5.2 Upper bounds on harmonic functions 365
- 15.6 Bibliographical notes 380

Part VI Applications: Lattice Systems in Small Volumes at Low Temperatures

- 16 Abstract Set-Up and Metastability in the Zero-Temperature Limit** 383
 - 16.1 Hypotheses and universal metastability theorems 383
 - 16.1.1 Metropolis dynamics and geometric definitions 384
 - 16.1.2 Metastability theorems and hypotheses 385
 - 16.1.3 Discussion 388
 - 16.1.4 Consequences of the hypotheses 389
 - 16.2 Preliminaries 390
 - 16.2.1 Dirichlet form and capacity 390
 - 16.2.2 A priori estimates on the capacity 391
 - 16.2.3 Graph structure of the energy landscape 394
 - 16.2.4 Metastable pair 395
 - 16.3 Proof of the metastability theorems 396
 - 16.3.1 Exponential distribution of the crossover time 396
 - 16.3.2 Average crossover time 397
 - 16.3.3 Gate for the crossover and uniform entrance distribution . 400
 - 16.4 Beyond Metropolis dynamics 403
 - 16.4.1 Heat-bath dynamics 403
 - 16.4.2 Probabilistic cellular automata 404
 - 16.5 Bibliographical notes 406
- 17 Glauber Dynamics** 409
 - 17.1 Introduction and main results 409
 - 17.1.1 Model 409
 - 17.1.2 Metastable regime and critical droplet size 410
 - 17.1.3 Main theorems 411
 - 17.1.4 Discussion 412
 - 17.2 Geometric definitions 413
 - 17.3 Verification of the two hypotheses 414
 - 17.3.1 First hypothesis 414
 - 17.3.2 Second hypothesis 416
 - 17.4 Structure of the communication level set 416
 - 17.5 Computation of the prefactor 419
 - 17.6 Extension to three dimensions 420
 - 17.7 Bibliographical notes 422

18 Kawasaki Dynamics 425

18.1 Introduction and main results 425

 18.1.1 Model 425

 18.1.2 Metastable regime and critical droplet size 427

 18.1.3 Main theorems 427

 18.1.4 Discussion 429

18.2 Geometric definitions 431

18.3 Verification of the two hypotheses 433

 18.3.1 First hypothesis 433

 18.3.2 Second hypothesis 434

18.4 Structure of the communication level set 434

 18.4.1 Canonical protocritical droplets 434

 18.4.2 Protocritical and critical droplets 439

 18.4.3 Identification of the protocritical and the critical set 443

 18.4.4 Motion on the plateau 443

 18.4.5 Cardinality of the set of protocritical droplets 446

18.5 Asymptotics of the prefactor for large volumes 447

 18.5.1 Geometry of critical droplets and wells 447

 18.5.2 Capacity bounds on the prefactor 448

 18.5.3 Capacity asymptotics 451

18.6 Extension to three dimensions 453

18.7 Bibliographical notes 456

Part VII Applications: Lattice Systems in Large Volumes at Low Temperatures

19 Glauber Dynamics 461

19.1 Introduction and main results 461

 19.1.1 Glauber dynamics in large volumes 461

 19.1.2 Main theorem 463

 19.1.3 Discussion 464

19.2 Average time to create a critical droplet 465

 19.2.1 Estimate of the equilibrium potential 465

 19.2.2 Estimate of the capacity 465

19.3 Average time to go beyond the critical droplet 471

 19.3.1 Estimate of the equilibrium potential 471

 19.3.2 Estimate of the capacity 471

19.4 Average time to grow a droplet twice the critical size 473

 19.4.1 Estimate of the equilibrium potential 474

 19.4.2 Estimate of the capacity 474

19.5 Sparseness of subcritical droplets 474

19.6 Typicality of starting configurations 475

19.7 Bibliographical notes 477

20	Kawasaki Dynamics	479
20.1	Introduction and main results	479
20.1.1	Kawasaki dynamics in large volumes	479
20.1.2	Main theorem	482
20.1.3	Discussion	483
20.2	Average time to create a critical droplet	483
20.2.1	Estimate of the equilibrium potential	483
20.2.2	Estimate of the capacity	484
20.3	Average time to grow a droplet twice the critical size	498
20.4	Equivalence of ensembles	498
20.4.1	Partition functions for different numbers of particles	499
20.4.2	Partition functions for different volumes	502
20.4.3	Atypicality of critical droplets	503
20.4.4	Typicality of starting configurations	504
20.5	The critical droplet is the threshold	506
20.6	Bibliographical notes	506
Part VIII Applications: Lattice Systems in Small Volumes at High Densities		
21	The Zero-Range Process	511
21.1	Model and basic properties	511
21.2	Metastable behaviour	513
21.2.1	Finite system size	513
21.2.2	Diverging system size	515
21.3	Capacity estimates	516
21.3.1	Lower bound	516
21.3.2	Upper bound	521
21.4	Proof of the main theorems	533
21.4.1	Finite system size	533
21.4.2	Diverging system size	534
21.5	Proof that the condensate configurations form a metastable set	535
21.6	Bibliographical notes	540
Part IX Challenges		
22	Challenges Within Metastability	545
22.1	Glauber dynamics in large volumes at small magnetic fields	545
22.1.1	Metastable crossover time	546
22.1.2	Wulff construction	547
22.1.3	Heuristics	549
22.2	Crystallisation in small volumes at low temperatures	549
22.2.1	Static model	550
22.2.2	Dynamic model	551
22.2.3	Metastability theorems for the soft disk potential	552
22.2.4	Extension to other pair potentials	554
22.3	Bibliographical notes	556

Contents	xxi
23 Challenges Beyond Metastability	559
23.1 Low temperatures	560
23.2 Small magnetic fields	562
23.3 Bibliographical notes	562
Glossary	565
