Part I  Force Feedback via Cutaneous Cues Only

1  Sensory Subtraction in Teleoperation: Substituting Haptic Force with Cutaneous Stimuli ........................................... 3
  1.1 Introduction .......................................................... 3
  1.2 From Grounded Haptic Interfaces to Ungrounded Cutaneous Devices ......................................................... 6
    1.2.1 Ungrounded Cutaneous Devices ............................. 7
  1.3 Cutaneous Feedback in Robotic Teleoperation ................. 10
    1.3.1 Normal Indentation ............................................ 11
    1.3.2 Lateral Skin Stretch and Relative Tangential Motion .... 14
    1.3.3 Vibration ..................................................... 15
  References .................................................................. 16

2  Needle Insertion in Simulated Soft Tissue ......................... 21
  2.1 Introduction .......................................................... 21
  2.2 An Ungrounded Fingertip Cutaneous Device .................. 22
  2.3 Experimental Evaluation ........................................... 23
    2.3.1 Experimental Setup .......................................... 23
    2.3.2 Design of the Experiments .................................. 25
    2.3.3 Experiment #1: Comparison of the Feedback Conditions ................................................................. 26
    2.3.4 Experiment #2: Sudden Change of the Stiff Constraint . 29
    2.3.5 Experiment #3: Stability with Time Delay ............... 30
  2.4 Discussion ........................................................... 33
  2.5 Conclusions ......................................................... 35
  References .................................................................. 36
3 Peg-in-Hole in Simulated and Real Scenarios

3.1 Introduction

3.2 A Fingertip Cutaneous Device for the Omega Interface

3.2.1 Related Works on Fingertip Compliance Models

3.2.2 Device Model and Control

3.3 Experimental Evaluation

3.3.1 Experiment #1: Teleoperation in a Virtual Environment

3.3.2 Methods

3.3.3 Experiment #2: Teleoperation in a Real Environment

3.4 Discussion

3.5 Conclusions

References

4 Remote Palpation Using the da Vinci Surgical System

4.1 Introduction

4.2 Cutaneous Feedback System for Remote Interaction: Contact Deformations

4.2.1 Sensing and Actuation Systems

4.2.2 Mapping Between Remote Sensed Data and Motor Commands

4.2.3 Experimental Evaluation

4.2.4 Discussion

4.3 Cutaneous Feedback System for Remote Interaction: Contact Deformations and Vibrotactile Cues

4.3.1 Sensing and Actuation Systems

4.3.2 Mapping Between Remote Sensed Data and Motor Commands

4.3.3 Experimental Evaluation

4.3.4 Discussion

4.4 Conclusions

References

Part II Force Feedback via Mixed Cutaneous and Kinesthetic Cues

5 Cutaneous and Kinesthetic Cues to Improve Transparency in Teleoperation

5.1 Introduction

5.2 An Ungrounded Fingertip Cutaneous Device

5.3 Compensating for a Reduction of Kinesthetic Feedback with Cutaneous Stimuli

5.3.1 Simple Compensation with Cutaneous Stimuli

5.3.2 Over-Compensation with Cutaneous Stimuli

References
5.4 Enhancing the Performance of Passive Teleoperation Systems with Cutaneous Stimuli .................................................. 104
  5.4.1 Time-Domain Passivity Control for Haptic Force Feedback .......................................................... 104
  5.4.2 Force Compensation with Cutaneous Stimuli ................................................................. 106
  5.4.3 Enhanced Cutaneous-Kinesthetic Control Algorithm ................................................. 107
5.5 Experimental Evaluation ................................................................. 107
  5.5.1 Experiment #1: Perceived Stiffness ................................................... 107
  5.5.2 Experiment #2: Teleoperated Needle Insertion in Soft Tissue ................................................. 112
5.6 Discussion ................................................................. 118
5.7 Conclusions ................................................................. 119
References ................................................................. 119

6 Cutaneous and Kinesthetic Cues for Enhanced Navigation Feedback in Teleoperation ..................................................... 121
  6.1 Introduction ................................................................. 121
  6.2 A Robotic Teleoperation System for Needle Insertion ..................................................... 125
  6.3 Mixing Sensory Cues for Enhanced Navigation ..................................................... 126
    6.3.1 Slave System ................................................................. 126
    6.3.2 Master System ................................................................. 129
  6.4 Experimental Evaluation ................................................................. 132
    6.4.1 Experiment #1: Teleoperation of Flexible Needles ..................................................... 132
    6.4.2 Experiment #2: Teleoperation in a Remote Scenario ..................................................... 136
  6.5 Discussion ................................................................. 136
  6.6 Conclusions ................................................................. 137
References ................................................................. 138

Conclusions and Future Work ................................................................. 141
