Part I Submodular Functions and Optimization

1	Submodular Functions and Matroids	3
1.1	Submodular Functions	3
1.2	Matroids	9
1.2.1	Definition and Examples	10
1.2.2	Matroid Basis, Rank, and Closure	11
1.2.3	Matroid Dual and Union	16
1.3	Summary and Notes	18
	References	18
2	Centralized Submodular Optimization	19
2.1	Applications of Submodular Maximization	19
2.1.1	Sensor Placement	20
2.1.2	Influence in Social Networks	20
2.1.3	Document Summarization	21
2.2	Cardinality-Constrained Submodular Maximization	21
2.3	Robust Submodular Maximization	26
2.4	Submodular Maximization with Matroid Constraints	28
2.5	Online Submodular Maximization	34
2.5.1	Background on Experts Algorithms	34
2.5.2	Online Submodular Maximization Algorithm	35
2.6	Summary and Notes	37
	References	38
3	Distributed Submodular Maximization	41
3.1	Distributed Greedy Algorithms	41
3.2	Exchange-Based Distributed Submodular Maximization Algorithms	44
3.2.1	Case Study	48

3.3 Submodular Maximization Using Parallel Processors 50

3.4 Summary and Notes 52

References 52

Part II Submodularity in Dynamics and Control

4 Background on Control of Networked Systems 57

4.1 Graph Theory 57

4.1.1 Definitions and Preliminaries 57

4.1.2 Algebraic Graph Theory 59

4.2 Consensus in Networked Systems 62

4.2.1 Consensus in Static Networks 63

4.2.2 Consensus in Networks with Switching Topology 65

4.2.3 Consensus of Second-Order Integrators 66

4.3 Distributed Monitoring and Estimation 68

4.3.1 Sensing Model 68

4.3.2 Distributed Estimation Dynamics 70

4.3.3 Convergence of Estimation Dynamics 71

4.4 Opinion Dynamics in Social Networks 73

4.4.1 The Stubborn Agent Interaction Model 74

4.5 Networked Systems with Input Nodes 76

4.5.1 Leader–Follower Containment 76

4.5.2 Distributed Estimation with Input Nodes 78

4.6 Summary and Notes 80

References 80

5 Submodular Optimization for Smooth Convergence 83

5.1 Convergence in Networked Systems 83

5.1.1 System Model and Convergence Error Metric 84

5.2 Submodular Optimization for Smooth Convergence
in Static Networks 85

5.2.1 Problem Formulation in Static Networks 86

5.2.2 Connection Between Convergence Error
and Random Walks 87

5.2.3 Supermodularity of Convergence Error 88

5.2.4 Algorithms for Smooth Convergence
in Static Networks 90

5.2.5 Case Study 92

5.3 Submodular Optimization for Smooth Convergence
in Dynamic Networks 93

5.3.1 Input Selection for Known Topology Dynamics 95

5.3.2 Input Selection under Unknown
Topology Dynamics 96

5.3.3 Case Study 102

- 5.4 Summary and Notes 103
- References 103
- 6 Selecting Catalyst Nodes for Synchronization 105**
 - 6.1 The Kuramoto Model 106
 - 6.1.1 Definition of the Model. 106
 - 6.1.2 Types of Synchronization 107
 - 6.2 Conditions for Synchronization 109
 - 6.2.1 Homogeneous Oscillators 109
 - 6.2.2 Heterogeneous Oscillators 110
 - 6.3 Submodular Optimization Approach to Practical Synchronization 115
 - 6.3.1 Ensuring Existence of a Positive Invariant Set 116
 - 6.3.2 Ensuring Convergence to Practical Synchronization . . . 119
 - 6.3.3 Submodular Optimization for Catalyst Selection. 122
 - 6.4 Synchronization Case Study 124
 - 6.5 Summary and Notes 125
 - References 126
- 7 Input Selection for Robustness to Noise. 129**
 - 7.1 Noise in Networked Systems. 129
 - 7.1.1 Sources and Impact of Noise 129
 - 7.1.2 Mitigating Noise in Networked Systems 130
 - 7.2 Modeling the Impact of Noise 131
 - 7.2.1 System Model 131
 - 7.2.2 Noise Metric Definition and Problem Formulation 132
 - 7.2.3 Connection Between Error and Effective Resistance . . . 134
 - 7.3 Convex Optimization Approach to Input Selection 136
 - 7.3.1 Convex Problem Mapping. 136
 - 7.4 Submodular Optimization Approach to Input Selection for Robustness to Noise 137
 - 7.4.1 Error Due to Noise and Commute Time 138
 - 7.4.2 Supermodularity of Error Due to Noise 140
 - 7.4.3 Input Selection Algorithms for Static Networks 142
 - 7.4.4 Case Study 145
 - 7.5 Minimizing Error Due to Noise in Dynamic Networks 146
 - 7.5.1 Input Selection under Random Failures 146
 - 7.5.2 Input Selection under Switching Topologies 148
 - 7.5.3 Input Selection under Arbitrary Time-Varying Topology 150
 - 7.5.4 Case Study 152
 - 7.6 Summary and Notes 153
 - References 154

8	Resilience to Link Noise Injection Attacks	157
8.1	Link Noise Injection Attacks	157
8.1.1	Mitigating Noise Injection	158
8.2	Noise Injection Model and Background.	158
8.2.1	System Model	158
8.2.2	Adversary Model	160
8.2.3	Background on Game Theory	160
8.3	Fixed Input Selection for Robustness	161
8.3.1	Stackelberg Game Formulation.	162
8.3.2	Characterizing the Attack Strategy	162
8.3.3	Fixed Input Selection	164
8.3.4	Case Study	165
8.4	Selecting a Time-Varying Input Set	166
8.4.1	Game Formulation	167
8.4.2	Equilibrium Analysis and Selection Algorithm	168
8.4.3	Repeated Strategy with Improved Optimality Bound.	169
8.4.4	Case Study	172
8.5	Summary and Notes	172
	References	173
9	Joint Performance and Controllability of Networked Systems	175
9.1	Controllability of Networked Systems.	175
9.2	Input Selection for Controllability	179
9.3	Input Selection for Performance and Controllability	181
9.3.1	Controllability as a Matroid Constraint	181
9.3.2	Graph Controllability Index	183
9.4	Controllability of Consensus Networks	186
9.4.1	Eigenvalue-Based Controllability Conditions	187
9.4.2	Graph Symmetry-Based Controllability Conditions	187
9.5	Joint Performance and Controllability in Consensus Networks.	188
9.5.1	Linear Descriptor Systems.	189
9.5.2	Controllability of Linear Descriptor Systems	190
9.5.3	Matroid Constraints for Controllability of Consensus Networks.	192
9.5.4	Input Selection Algorithms for Controllability	194
9.5.5	Performance and Controllability of Consensus Networks	195
9.5.6	Case Study	197
9.6	Summary and Notes	197
