2 Other Types of Intermittency and Some Recent Advances in the Study of Chaotic Intermittency ................................................. 25
   2.1 Introduction ................................................................................. 25
   2.2 Type-V Intermittency ............................................................... 26
   2.3 Type-X Intermittency ............................................................... 29
   2.4 On–Off Intermittency ............................................................... 32
   2.5 Eyelet Intermittency ................................................................. 33
   2.6 Spatiotemporal Intermittency ................................................. 35
   2.7 Crisis-Induced Intermittency .................................................. 36
   2.8 Fine Structure in Intermittency .............................................. 38
   2.9 Two-Dimensional Intermittency .............................................. 40
   2.10 Horizontal Visibility Graphs Method ..................................... 41
      2.10.1 Transformation of Intermittent Time Series
            Into Horizontal Visibility Graphs .................................... 42
      2.10.2 Degree Distribution \( P(k) \) .................................................. 43
      2.10.3 Variance \( \sigma^2_k = \bar{k}^2 - \bar{k}^2 \): Graph Analogue of \( \bar{\ell} \) ... 46
      2.10.4 Scaling of Lyapunov Exponent: Block Entropies \( h_n \) ............. 46
   2.11 Multichannel Reinjection ....................................................... 47
   2.12 Intermittency Cascade ............................................................ 48
   2.13 Experimental Evidence in Electric Circuits ........................... 50

5 New Formulation of the Chaotic Intermittency ............................................. 83
  5.1 Introduction .................................................................................................. 83
  5.2 The Reinjection Probability Density Function ............................................. 84
  5.3 The Function $M(x)$ ................................................................................... 90
    5.3.1 Fitting Linear Model to Experimental Data ...................................... 91
    5.3.2 How to Deal with Short Data Sets .................................................... 92
  5.4 Analytical Estimation of the RPD ............................................................... 94
  5.5 Type-II Intermittency .................................................................................. 96
    5.5.1 Length of Laminar Phase ................................................................. 96
    5.5.2 Characteristic Relations ................................................................. 97
  5.6 Type-III Intermittency ................................................................................ 101
    5.6.1 Length of Laminar Phase ................................................................. 103
  5.7 Type-I Intermittency .................................................................................. 103
    5.7.1 Length of Laminar Phase ................................................................. 103
    5.7.2 Characteristic Relations ................................................................. 106
  5.8 Remarks on the Characteristic Exponent $\beta$ ............................................. 107
