Contents

1 Introduction ............................................. 1
   1.1 Motivation, Challenges, and Objectives ............... 1
   1.2 Vehicle Design Aspects .............................. 3
      1.2.1 Stages of Energy Conversion .................... 4
      1.2.2 Real-World Driving Profile, Consumption,
           and Emissions ................................ 8
   1.3 Process Model, Control Strategy, and Optimization .... 10
      1.3.1 General Problem Statement ..................... 10
      1.3.2 Energy Management ........................... 12
      1.3.3 Numerical Solutions ........................... 16
   1.4 Bibliographical Notes ................................ 19
References ............................................... 20

Part I Theory and Formulations

2 Introduction to Nonlinear Programming .................... 27
   2.1 Introduction ........................................ 27
   2.2 Unconstrained Nonlinear Optimization .................. 30
      2.2.1 Necessary and Sufficient Conditions for Optimality. . 31
      2.2.2 Newton–Raphson Method ........................ 31
      2.2.3 Globalization of the Newton–Raphson Method .... 34
      2.2.4 Quasi-Newton Method. .......................... 37
   2.3 Constrained Nonlinear Optimization ..................... 39
      2.3.1 Necessary and Sufficient Conditions for Optimality. . 41
      2.3.2ProjectedHessian ............................. 44
      2.3.3 Sequential Quadratic Programming ............... 46
   2.4 Sensitivity Analysis .................................. 54
      2.4.1 Sensitivity Analysis of the Objective Function
           and Constraints ............................... 58
      2.4.2 Linear Perturbations ............................ 63
2.4.3 Approximation of the Perturbed Solution .......... 64
2.4.4 Approximation of the Confidence Region .......... 66
2.5 Multi-Objective Optimization .................................. 67
2.5.1 Elitist Multi-Objective Evolutionary Algorithm .......... 68
2.5.2 Remarks for MOGAs ........................................ 72
2.6 Bibliographical Notes ........................................ 73
References .......................................................... 74

3 Hybrid Systems and Hybrid Optimal Control ............... 79
3.1 Introduction .................................................... 79
3.2 System Definition ............................................ 80
3.2.1 Continuous Systems ..................................... 80
3.2.2 Hybrid Systems .......................................... 83
3.2.3 Controlled Hybrid Systems and Switched Systems ...... 86
3.2.4 Existence and Uniqueness of Admissible States and Controls ........................................ 88
3.2.5 Control and State Constraints, Admissible Sets, and Admissible Function Spaces ....................... 91
3.2.6 Reformulation of Switched Systems ..................... 94
3.3 Optimal Control Problem Formulations ..................... 96
3.3.1 Functionals ................................................. 96
3.3.2 Boundary Conditions ..................................... 97
3.3.3 Continuous Optimal Control Problem ................. 98
3.3.4 Hybrid Optimal Control Problem ....................... 100
3.3.5 Switched Optimal Control Problem .................... 101
3.3.6 Binary Switched Optimal Control Problem .......... 102
3.3.7 Transformations of Optimal Control Problems .......... 103
3.4 Bibliographical Notes ......................................... 110
References .......................................................... 112

4 The Minimum Principle and Hamilton–Jacobi–Bellman Equation .................................................. 117
4.1 Introduction .................................................... 117
4.1.1 The Calculus of Variations .............................. 117
4.1.2 Deriving First-Order Necessary Conditions for an Extremum of an Optimal Control Problem ........... 120
4.2 Minimum Principle ............................................. 125
4.2.1 Necessary Conditions for Optimal Control Problems with Control Restraints ............................. 128
4.2.2 Necessary Conditions for Optimal Control Problems with State Constraints ............................. 131
4.2.3 Necessary Conditions for Optimal Control Problems with Affine Controls ................................ 137
4.3 Hamilton–Jacobi–Bellman Equation .......................... 140
Part II Methods for Optimal Control

5 Discretization and Integration Schemes for Hybrid Optimal Control Problems

5.1 Introduction ........................................ 167
5.2 Discretization of the Initial Value Problem ............... 168
5.3 Runge–Kutta Integration Scheme ........................ 169
5.4 Consistence Order of Runge–Kutta Methods ................ 174
5.5 Stability ........................................... 183
5.6 Some Lower–Order Runge–Kutta Integration Schemes ....... 185
  5.6.1 Explicit Runge–Kutta Schemes ................... 186
  5.6.2 Implicit Runge–Kutta Schemes ................... 189
5.7 Remarks for Integration Schemes for Switched System with Discontinuities .................................. 194
5.8 Consequences of the Discretization to Optimal Control Problems ........................................... 195
5.9 Bibliographical Notes .................................. 196
References ............................................... 197

6 Dynamic Programming .................................... 199

6.1 Introduction ........................................ 199
6.2 Optimal Control for Continuous Systems .................. 200
6.3 Optimal Control of Hybrid Systems ..................... 206
6.4 Discussion ......................................... 210
6.5 Bibliography ........................................ 212
References ............................................... 213

7 Indirect Methods for Optimal Control

7.1 Introduction ........................................ 215
7.2 Optimal Control for Continuous Systems .................. 216
  7.2.1 Indirect Shooting Method ....................... 216
  7.2.2 Indirect Multiple Shooting Method .......... 221
7.3 Optimal Control for Hybrid Systems ..................... 225
7.4 Discussion ......................................... 228
8 Direct Methods for Optimal Control

8.1 Introduction ........................................ 233
8.2 Optimal Control for Continuous Systems ................. 239
  8.2.1 Direct Shooting ................................ 240
  8.2.2 Direct Collocation .............................. 245
  8.2.3 Comparison of Direct Shooting and Direct
       Collocation ..................................... 247
  8.2.4 Recovering the Costates from a Direct Shooting
       and Direct Collocation ........................ 247
8.3 Optimal Control for Switched Systems .................... 249
  8.3.1 Embedded Optimal Control Problem ............... 250
  8.3.2 Two-Stage Algorithm .......................... 253
  8.3.3 Switching Time Optimization with Parameterized
       Switching Intervals ............................ 257
8.4 Numerical Methods for Obtaining Binary Feasible Control
       Functions ...................................... 261
8.5 Discussion ......................................... 266
8.6 Bibliography ........................................ 267
References ............................................... 270

Part III Numerical Implementations

9 Practical Implementation Aspects of Large-Scale Optimal
  Control Solvers ........................................ 277
  9.1 Sparse Linear Algebra ................................ 277
    9.1.1 Sparse Matrix Formats ...................... 277
    9.1.2 Numerical Solution of Large-Scale Linear Systems .. 278
    9.1.3 Checking the Positive Definiteness of Large-Scale
           Matrices .................................... 282
  9.2 Calculating Derivatives ............................. 283
    9.2.1 Computational Graphs ....................... 283
    9.2.2 Sparsity Pattern Determination .............. 284
    9.2.3 Compressed Derivative Calculation .......... 288
    9.2.4 Finite Differences .......................... 291
  9.3 Sparse Quasi-Newton Updates ........................ 295
    9.3.1 Quasi-Newton Update for Partially Separable
           Function ................................... 295
    9.3.2 Simple Quasi-Newton Update for Chordal Sparsity
           Structures .................................. 296
    9.3.3 Quasi-Newton Update for Chordal
           Sparsity Structures ........................ 298
9.3.4 Modifications of the Quasi-Newton Update
9.3.5 Quasi-Newton Updates for Discretized Optimal Control Problems
9.4 Bibliographical Notes
References

Part IV Modeling of Hybrid Vehicles for Control

10 Modeling Hybrid Vehicles as Switched Systems
10.1 Introduction
10.2 Vehicle Dynamics
10.3 Mechatronic Systems
10.3.1 Internal Combustion Engine
10.3.2 Electric Machine
10.3.3 Gearbox
10.3.4 Clutch
10.3.5 Battery
10.4 Hybrid Vehicle Configurations
10.4.1 Parallel Hybrids
10.4.2 Power-Split Hybrids
10.4.3 Serial Hybrids
10.4.4 Combined Hybrids
10.4.5 Plug-In Hybrids
10.4.6 Battery Electric Vehicles
10.5 Hybrid Vehicle Models
10.5.1 Quasi-static Model for Parallel Hybrids
10.5.2 Thermodynamic Model for Parallel Hybrids Using Spark Ignition Engines
10.5.3 Quasi-static Model for Power-Split Hybrids
10.5.4 Extended Quasi-static Model for Parallel Hybrids
10.6 Drive Cycles
10.7 Static Function Representation
10.8 Switching Costs
10.9 Bibliographical Notes
References

Part V Applications

11 Advanced Vehicle Calibration
11.1 Introduction
11.2 Offline Solution of Switched Optimal Control Problems for Known Driving Profiles
11.3 Analytical Calibration for Rule-Based Energy Managements ... 412
11.3.1 Constant Costate Assumption .................... 414
11.3.2 Influence of Switching Costs ................. 416
11.3.3 Lookup Table Calculation ...................... 417
11.4 Rule-Based Strategies for Choosing the Costate ... 421
11.4.1 Rule-Based Selection Using Costate Maps .... 422
11.4.2 Costate for Optimal CO₂ Emissions ......... 423
11.5 Implementation Issues .................................. 424
11.6 Bibliography ........................................ 426
References ............................................... 427

12 Predictive Real-Time Energy Management ............ 429
12.1 Introduction ........................................ 429
12.2 Real-World Benchmark-Cycles ..................... 431
12.3 Intelligent Traffic System ....................... 433
12.3.1 Time-Based Driver Model .................... 434
12.3.2 Spatial-Based Driver Model ................. 436
12.3.3 Estimation of Stop Events .................... 439
12.4 Predictive Energy Management for Battery Electric Vehicles ................. 440
12.4.1 Vehicle Model ................................ 442
12.4.2 Dynamic Programming for the Maximal Speed Limit ..................... 443
12.4.3 Instantaneous Speed Limit Corrections ......... 445
12.4.4 Experimental Results ........................ 446
12.5 Predictive Energy Management for Hybrid Vehicles ......... 447
12.5.1 Event-Triggered Predictive Energy Management .......... 450
12.5.2 Predictive Energy Management with Long Prediction Horizon ........... 460
12.6 Bibliographical Notes ................................ 474
References ............................................... 478

13 Optimal Design of Hybrid Powertrain Configurations .... 481
13.1 Introduction ........................................ 481
13.2 Process Description ..................... 482
13.2.1 Drivability Performance Index ................. 482
13.2.2 Design Parameters ............................ 483
13.2.3 Powertrain Dynamics ....................... 484
13.3 Multi-objective Powertrain Design ................. 486
13.3.1 Master Problem ................................. 488
13.3.2 Map Scaling for Powertrain Components .... 488
13.3.3 Batched Optimal Control Subproblems ....... 491
13.4 P2-Hybrid Design Study ....................... 498
13.5 Post Optimal Parametric Sensitivity Analysis .......... 507
Hybrid Systems, Optimal Control and Hybrid Vehicles
Theory, Methods and Applications
