Preface.......................................................... VII
Motivation...................................................... VII
Aims, Readership and Book Structure ...................... XII
Final Word and Acknowledgments .......................... XIV
Description of Contents by Chapter ....................... XIX

Abbreviations and Notation ................................. XXXV

Part I. BASIC DEFINITIONS AND NO ARBITRAGE

1. Definitions and Notation .................................. 1
   1.1 The Bank Account and the Short Rate .................. 2
   1.2 Zero-Coupon Bonds and Spot Interest Rates .......... 4
   1.3 Fundamental Interest-Rate Curves .................... 9
   1.4 Forward Rates .................................... 11
   1.5 Interest-Rate Swaps and Forward Swap Rates ........ 13
   1.6 Interest-Rate Caps/Floors and Swaptions .......... 16

2. No-Arbitrage Pricing and Numeraire Change .......... 23
   2.1 No-Arbitrage in Continuous Time .................... 24
   2.2 The Change-of-Numeraire Technique .................. 26
   2.3 A Change of Numeraire Toolkit
       (Brigo & Mercurio 2001c) ............................ 28
       2.3.1 A helpful notation: “DC” ....................... 35
   2.4 The Choice of a Convenient Numeraire ............... 37
   2.5 The Forward Measure ................................ 38
   2.6 The Fundamental Pricing Formulas .................. 39
       2.6.1 The Pricing of Caps and Floors ............... 40
   2.7 Pricing Claims with Deferred Payoffs ............... 42
   2.8 Pricing Claims with Multiple Payoffs ............... 42
   2.9 Foreign Markets and Numeraire Change ............... 44
### Part II. FROM SHORT RATE MODELS TO HJM

#### 3. One-factor short-rate models

3.13.2 The Extended Exponential-Vasicek Model ............... 131
3.14 An Example of Calibration to Real-Market Data .......... 132

4. Two-Factor Short-Rate Models ............................. 137
4.1 Introduction and Motivation ................................ 137
4.2 The Two-Additive-Factor Gaussian Model G2++ ............ 142
  4.2.1 The Short-Rate Dynamics ............................. 143
  4.2.2 The Pricing of a Zero-Coupon Bond ................... 144
  4.2.3 Volatility and Correlation Structures in Two-Factor
       Models ........................................ 148
  4.2.4 The Pricing of a European Option on a Zero-Coupon
       Bond ............................................ 153
  4.2.5 The Analogy with the Hull-White Two-Factor Model .... 159
  4.2.6 The Construction of an Approximating Binomial Tree. 162
  4.2.7 Examples of Calibration to Real-Market Data .......... 166
4.3 The Two-Additive-Factor Extended CIR/LS Model CIR2++ 175
  4.3.1 The Basic Two-Factor CIR2 Model ..................... 176
  4.3.2 Relationship with the Longstaff and Schwartz Model
       (LS) ......................................... 177
  4.3.3 Forward-Measure Dynamics and Option Pricing for
       CIR2 ......................................... 178
  4.3.4 The CIR2++ Model and Option Pricing ................ 179

5. The Heath-Jarrow-Morton (HJM) Framework .................. 183
5.1 The HJM Forward-Rate Dynamics ............................ 185
5.2 Markovianity of the Short-Rate Process .................... 186
5.3 The Ritchken and Sankarasubramanian Framework ........... 187
5.4 The Mercurio and Moraleda Model ......................... 191

Part III. MARKET MODELS

6. The LIBOR and Swap Market Models (LFM and LSM) .......... 195
6.1 Introduction ............................................. 195
6.2 Market Models: a Guided Tour ............................ 196
6.3 The Lognormal Forward-LIBOR Model (LFM) .................. 207
  6.3.1 Some Specifications of the Instantaneous Volatility of
       Forward Rates .................................. 210
  6.3.2 Forward-Rate Dynamics under Different Numeraires .... 213
6.4 Calibration of the LFM to Caps and Floors Prices ........... 220
  6.4.1 Piecewise-Constant Instantaneous-Volatility Structures 223
  6.4.2 Parametric Volatility Structures ..................... 224
  6.4.3 Cap Quotes in the Market ............................ 225
6.5 The Term Structure of Volatility .......................... 226
  6.5.1 Piecewise-Constant Instantaneous Volatility Structures 228
# Table of Contents

6.5.2 Parametric Volatility Structures ............................................. 231
6.6 Instantaneous Correlation and Terminal Correlation ............... 234
6.7 Swaptions and the Lognormal Forward-Swap Model (LSM) ..... 237
   6.7.1 Swaptions Hedging .................................................. 241
   6.7.2 Cash-Settled Swaptions ............................................. 243
6.8 Incompatibility between the LFM and the LSM ....................... 244
6.9 The Structure of Instantaneous Correlations ............................ 246
   6.9.1 Some convenient full rank parameterizations ............... 248
   6.9.2 Reduced-rank formulations: Rebonato’s angles and eigen-
        values zeroing ....................................................... 250
   6.9.3 Reducing the angles ................................................ 259
6.10 Monte Carlo Pricing of Swaptions with the LFM ................. 264
6.11 Monte Carlo Standard Error ................................................ 266
6.12 Monte Carlo Variance Reduction: Control Variate Estimator .... 269
6.13 Rank-One Analytical Swaption Prices ................................... 271
6.14 Rank-r Analytical Swaption Prices ...................................... 277
6.15 A Simpler LFM Formula for Swaptions Volatilities ............... 281
6.16 A Formula for Terminal Correlations of Forward Rates .......... 284
6.17 Calibration to Swaptions Prices .......................................... 287
6.18 Instantaneous Correlations: Inputs (Historical Estimation) or
   Outputs (Fitting Parameters)? ............................................ 290
6.19 The exogenous correlation matrix ........................................ 291
   6.19.1 Historical Estimation ............................................. 292
   6.19.2 Pivot matrices .................................................... 295
6.20 Connecting Caplet and $S \times 1$-Swaption Volatilities ........... 300
6.21 Forward and Spot Rates over Non-Standard Periods ............... 307
   6.21.1 Drift Interpolation ................................................ 308
   6.21.2 The Bridging Technique .......................................... 310

7. Cases of Calibration of the LIBOR Market Model .................... 313
   7.1 Inputs for the First Cases ............................................. 315
   7.2 Joint Calibration with Piecewise-Constant Volatilities as in
       TABLE 5 .................................................................. 315
   7.3 Joint Calibration with Parameterized Volatilities as in For-
       mulation 7 .................................................................. 319
   7.4 Exact Swaptions “Cascade” Calibration with Volatilities as
       in TABLE 1 ............................................................... 322
       7.4.1 Some Numerical Results ......................................... 330
   7.5 A Pause for Thought ....................................................... 337
       7.5.1 First summary ....................................................... 337
       7.5.2 An automatic fast analytical calibration of LFM to
            swaptions. Motivations and plan .............................. 338
   7.6 Further Numerical Studies on the Cascade Calibration Algo-
       rithm .................................................................. 340

             Rate Swaps .......................................... 566
   13.9 Average Rate Caps .......................................... 568
   13.10 Captions and Floortions ................................. 570
   13.11 Zero-Coupon Swaptions ................................... 571
   13.12 Eurodollar Futures ....................................... 575
      13.12.1 The Shifted Two-Factor Vasicek G2++ Model ....... 576
      13.12.2 Eurodollar Futures with the LFM ................... 577
   13.13 LFM Pricing with “In-Between” Spot Rates ................ 578
      13.13.1 Accrual Swaps ....................................... 579
      13.13.2 Trigger Swaps ....................................... 582
   13.14 LFM Pricing with Early Exercise and Possible Path Dependence584
   13.15 LFM: Pricing Bermudan Swaptions ........................ 588
      13.15.1 Least Squared Monte Carlo Approach ................. 589
      13.15.2 Carr and Yang’s Approach .......................... 591
14. Pricing Derivatives on Two Interest-Rate Curves .......... 607
   14.1 The Attractive Features of G2++ for Multi-Curve Payoffs . 608
      14.1.1 The Model ................................... 608
      14.1.2 Interaction Between Models of the Two Curves “1”
            and “2” ........................................ 610
      14.1.3 The Two-Models Dynamics under a Unique Conve-
            nient Forward Measure .......................... 611
   14.2 Quanto Constant-Maturity Swaps ....................... 613
      14.2.1 Quanto CMS: The Contract ........................ 613
      14.2.2 Quanto CMS: The G2++ Model ................... 615
      14.2.3 Quanto CMS: Quanto Adjustment .................. 621
   14.3 Differential Swaps ................................ 623
      14.3.1 The Contract .................................. 623
      14.3.2 Differential Swaps with the G2++ Model .......... 624
      14.3.3 A Market-Like Formula .......................... 626
   14.4 Market Formulas for Basic Quanto Derivatives .......... 626
      14.4.1 The Pricing of Quanto Caplets/Floorlets .......... 627
      14.4.2 The Pricing of Quanto Caps/Floors .............. 628
      14.4.3 The Pricing of Differential Swaps ............... 629
      14.4.4 The Pricing of Quanto Swaptions ................ 630
   14.5 Pricing of Options on two Currency LIBOR Rates ........ 633
      14.5.1 Spread Options ................................ 635
      14.5.2 Options on the Product .......................... 637
      14.5.3 Trigger Swaps ................................ 638
      14.5.4 Dealing with Multiple Dates ...................... 639

Part VI. INFLATION

15. Pricing of Inflation-Indexed Derivatives .................... 643
    15.1 The Foreign-Currency Analogy .......................... 644
    15.2 Definitions and Notation ................................ 645
    15.3 The JY Model ....................................... 646

16. Inflation-Indexed Swaps .................................. 649
    16.1 Pricing of a ZCIIS .................................. 649
    16.2 Pricing of a YYIIS .................................. 651
    16.3 Pricing of a YYIIS with the JY Model ................. 652
    16.4 Pricing of a YYIIS with a First Market Model .......... 654
16.5 Pricing of a YYIIS with a Second Market Model .......... 657

17. Inflation-Indexed Caplets/Floorlets ......................... 661
   17.1 Pricing with the JY Model ............................ 661
   17.2 Pricing with the Second Market Model ................. 663
   17.3 Inflation-Indexed Caps ............................... 665

18. Calibration to market data .................................. 669

19. Introducing Stochastic Volatility ........................... 673
   19.1 Modeling Forward CPI’s with Stochastic Volatility .... 674
   19.2 Pricing Formulae ...................................... 676
      19.2.1 Exact Solution for the Uncorrelated Case ....... 677
      19.2.2 Approximated Dynamics for Non-zero Correlations .. 680
   19.3 Example of Calibration ................................ 681

20. Pricing Hybrids with an Inflation Component ............... 689
    20.1 A Simple Hybrid Payoff ............................... 689

Part VII. CREDIT

    21.1 Introduction and Guided Tour .......................... 696
       21.1.1 Reduced form (Intensity) models .................. 697
       21.1.2 CDS Options Market Models ....................... 699
       21.1.3 Firm Value (or Structural) Models ................ 702
       21.1.4 Further Models ................................. 704
       21.1.5 The Multi-name picture: FtD, CDO and Copula Func-
              tions ........................................ 705
       21.1.6 First to Default (FtD) Basket .................... 705
       21.1.7 Collateralized Debt Obligation (CDO) Tranches .... 707
       21.1.8 Where can we introduce dependence? .............. 708
       21.1.9 Copula Functions ................................. 710
       21.1.10 Dynamic Loss models ............................. 718
       21.1.11 What data are available in the market? .......... 719
    21.2 Defaultable (corporate) zero coupon bonds .............. 723
       21.2.1 Defaultable (corporate) coupon bonds ............. 724
    21.3 Credit Default Swaps and Defaultable Floaters .......... 724
       21.3.1 CDS payoffs: Different Formulations ............... 725
       21.3.2 CDS pricing formulas ............................. 727
       21.3.3 Changing filtration: $\mathcal{F}_t$ without default VS complete $\mathcal{G}_t$ ................. 728
       21.3.4 CDS forward rates: The first definition ............ 730
21.3.5 Market quotes, model independent implied survival probabilities and implied hazard functions .............. 731
21.3.6 A simpler formula for calibrating intensity to a single CDS .................................................................................. 735
21.3.7 Different Definitions of CDS Forward Rates and Analogies with the LIBOR and SWAP rates .................... 737
21.3.8 Defaultable Floater and CDS ................................................................. 739
21.4 CDS Options and Callable Defaultable Floaters .................. 743
21.5 Constant Maturity CDS ................................................................. 744
    21.5.1 Some interesting Financial features of CMCDS ................. 745
21.6 Interest-Rate Payoffs with Counterparty Risk ................. 747
    21.6.1 General Valuation of Counterparty Risk ......................... 748
    21.6.2 Counterparty Risk in single Interest Rate Swaps (IRS) .... 750

22. Intensity Models ........................................................................ 757
    22.1 Introduction and Chapter Description ................................. 757
    22.2 Poisson processes ................................................................. 759
        22.2.1 Time homogeneous Poisson processes ......................... 760
        22.2.2 Time inhomogeneous Poisson Processes ................. 761
        22.2.3 Cox Processes .......................................................... 763
    22.3 CDS Calibration and Implied Hazard Rates/ Intensities ...... 764
    22.4 Inducing dependence between Interest-rates and the default event ................................................................. 776
    22.5 The Filtration Switching Formula: Pricing under partial information ................................................................. 777
    22.6 Default Simulation in reduced form models ....................... 778
        22.6.1 Standard error .......................................................... 781
        22.6.2 Variance Reduction with Control Variate .................. 783
    22.7 Stochastic Intensity: The SSRD model ................................. 785
        22.7.1 A two-factor shifted square-root diffusion model for intensity and interest rates (Brigo and Alfonsi (2003)). 786
        22.7.2 Calibrating the joint stochastic model to CDS: Separability .............................................................. 789
        22.7.3 Discretization schemes for simulating \((\lambda, r)\) .............. 797
        22.7.4 Study of the convergence of the discretization schemes for simulating CIR processes (Alfonsi (2005)) .......... 801
        22.7.5 Gaussian dependence mapping: A tractable approximated SSRD ......................................................... 812
        22.7.6 Numerical Tests: Gaussian Mapping and Correlation Impact ................................................................. 815
        22.7.7 The impact of correlation on a few “test payoffs” .......... 817
        22.7.8 A pricing example: A Cancellable Structure ............... 818
        22.7.9 CDS Options and Jamshidian’s Decomposition ........... 820
        22.7.10 Bermudan CDS Options .............................................. 830
22.8 Stochastic diffusion intensity is not enough: Adding jumps.
   The JCIR(++) Model .......................................................... 830
22.8.1 The jump-diffusion CIR model (JCIR) .................................... 831
22.8.2 Bond (or Survival Probability) Formula.................................. 832
22.8.3 Exact calibration of CDS: The JCIR++ model ......................... 833
22.8.4 Simulation .................................................................... 833
22.8.5 Jamshidian’s Decomposition .............................................. 834
22.8.6 Attaining high levels of CDS implied volatility ........................ 836
22.8.7 JCIR(++) models as a multi-name possibility ......................... 837
22.9 Conclusions and further research ........................................... 838

23. CDS Options Market Models ................................................. 841
23.1 CDS Options and Callable Defaultable Floaters ....................... 844
23.1.1 Once-callable defaultable floaters ....................................... 846
23.2 A market formula for CDS options and callable defaultable floaters ................................................................. 847
23.2.1 Market formulas for CDS Options ....................................... 847
23.2.2 Market Formula for callable DFRN ...................................... 849
23.2.3 Examples of Implied Volatilities from the Market ................. 852
23.3 Towards a Completely Specified Market Model ......................... 854
23.3.1 First Choice. One-period and two-period rates ....................... 855
23.3.2 Second Choice: Co-terminal and one-period CDS rates market model ..................................................... 860
23.3.3 Third choice. Approximation: One-period CDS rates dynamics ................................................................. 861
23.4 Hints at Smile Modeling ...................................................... 863
23.5 Constant Maturity Credit Default Swaps (CMCDS) with the market model ................................................................. 864
23.5.1 CDS and Constant Maturity CDS ....................................... 864
23.5.2 Proof of the main result .................................................... 867
23.5.3 A few numerical examples ............................................... 869

Part VIII. APPENDICES

A. Other Interest-Rate Models .................................................... 877
A.1 Brennan and Schwartz’s Model .............................................. 877
A.2 Balduzzi, Das, Foresi and Sundaram’s Model ............................. 878
A.3 Flesaker and Hughston’s Model ............................................. 879
A.4 Rogers’s Potential Approach ................................................... 881
A.5 Markov Functional Models ..................................................... 881
B. Pricing Equity Derivatives under Stochastic Rates ................................. 883
   B.1 The Short Rate and Asset-Price Dynamics .................................. 883
      B.1.1 The Dynamics under the Forward Measure ......................... 886
   B.2 The Pricing of a European Option on the Given Asset .................... 888
   B.3 A More General Model .......................................................... 889
      B.3.1 The Construction of an Approximating Tree for $r$ .............. 890
      B.3.2 The Approximating Tree for $S$ ..................................... 892
      B.3.3 The Two-Dimensional Tree ............................................. 893

C. A Crash Intro to Stochastic Differential Equations and Poisson Processes ................................................. 897
   C.1 From Deterministic to Stochastic Differential Equations ............. 897
   C.2 Ito’s Formula ................................................................. 904
   C.3 Discretizing SDEs for Monte Carlo: Euler and Milstein Schemes .... 906
   C.4 Examples ................................................................. 908
   C.5 Two Important Theorems .................................................... 910
   C.6 A Crash Intro to Poisson Processes ...................................... 913
      C.6.1 Time inhomogeneous Poisson Processes ............................. 915
      C.6.2 Doubly Stochastic Poisson Processes (or Cox Processes) .... 916
      C.6.3 Compound Poisson processes ...................................... 917
      C.6.4 Jump-diffusion Processes ............................................ 918

D. A Useful Calculation ................................................................. 919

E. A Second Useful Calculation ..................................................... 921

F. Approximating Diffusions with Trees .......................................... 925

G. Trivia and Frequently Asked Questions ........................................ 931

H. Talking to the Traders ............................................................... 935

References ................................................................................. 951

Index ......................................................................................... 967
Interest Rate Models - Theory and Practice
With Smile, Inflation and Credit
Brigo, D.; Mercurio, F.
2006, LVI, 982 p., Hardcover
ISBN: 978-3-540-22149-4
