

Table of Contents

1	Getting Started	1
1.1	The First Diffpack Encounter	3
1.1.1	What is Diffpack?	3
1.1.2	A Simple C++ Program	5
1.1.3	A Simple Diffpack Program	6
1.2	Overview of Application Examples	7
1.2.1	Very Simple Introductory Program Examples	8
1.2.2	Finite Difference Simulators	9
1.2.3	Finite Element Simulators	10
1.2.4	More Advanced Applications	11
1.3	Steady One-Dimensional Heat Conduction	12
1.3.1	The Physical and Mathematical Model	12
1.3.2	A Finite Difference Method	15
1.3.3	Implementation in Diffpack	18
1.3.4	Dissection of the Program	22
1.3.5	Tridiagonal Matrices	23
1.3.6	Variable Coefficients	24
1.3.7	A Nonlinear Heat Conduction Problem	28
1.4	Simulation of Waves	32
1.4.1	Modeling Vibrations of a String	33
1.4.2	A Finite Difference Method	35
1.4.3	Implementation	38
1.4.4	Visualizing the Results	41
1.4.5	Automating Simulation and Visualization in Scripts	45
1.4.6	A 2D Wave Equation with Variable Wave Velocity	52
1.4.7	A Model for Water Waves	56
1.5	Projects	62
1.5.1	A Uni-Directional Wave Equation	62
1.5.2	Centered Differences for a Boundary-Layer Problem	63
1.5.3	Upwind Differences for a Boundary-Layer Problem	64
1.6	About Programming with Objects	65
1.6.1	Motivation for the Object Concept	67
1.6.2	Example: Implementation of a Vector Class in C++	73
1.6.3	Arrays in Diffpack	81
1.6.4	Example: Design of an ODE Solver Environment	87
1.6.5	Abstractions for Grids and Fields	98
1.7	Coding the PDE Simulator as a Class	101
1.7.1	Steady 1D Heat Conduction Revisited	102
1.7.2	Nonlinear 1D Heat Conduction Revisited	107
1.7.3	Empirical Investigation of a Numerical Method	109

1.7.4	Simulation of 1D Waves Revisited	114
1.7.5	Simulation of 2D Waves Revisited	119
1.7.6	Transient Heat Conduction	121
1.8	Projects	131
1.8.1	Transient Flow Between Moving Plates	131
1.8.2	Transient Channel Flow	133
1.8.3	Coupled Heat and Fluid Flow	134
1.8.4	Difference Schemes for Transport Equations	136
1.8.5	3D Sound Waves	138
2	Introduction to Finite Element Discretization	141
2.1	Weighted Residual Methods	142
2.1.1	Basic Principles	142
2.1.2	Example: A 1D Poisson Equation	144
2.1.3	Treatment of Boundary Conditions	148
2.2	Time Dependent Problems	152
2.2.1	A Wave Equation	153
2.2.2	A Heat Equation	155
2.3	Finite Elements in One Space Dimension	157
2.3.1	Piecewise Polynomials	157
2.3.2	Handling of Essential Boundary Conditions	160
2.3.3	Direct Computation of the Linear System	161
2.3.4	Element-by-Element Formulation	163
2.3.5	Extending the Concepts to Quadratic Elements	171
2.3.6	Summary of the Element-by-Element Algorithm	174
2.4	Example: A 1D Wave Equation	176
2.4.1	The Finite Element Equations	176
2.4.2	Interpretation of the Discrete Equations	177
2.4.3	Accuracy and Stability	179
2.5	Naive Implementation	183
2.6	Projects	189
2.6.1	Steady Heat Conduction with Cooling Law	189
2.6.2	Stationary Pipe Flow	190
2.6.3	Transient Pipe Flow	192
2.6.4	Retardation of a Well-Bore	193
2.7	Higher-Dimensional Finite Elements	195
2.7.1	The Bilinear Element and Generalizations	196
2.7.2	The Linear Triangle	198
2.7.3	Example: A 2D Wave Equation	200
2.7.4	Other Two-Dimensional Element Types	203
2.7.5	Three-Dimensional Elements	204
2.8	Calculation of Derivatives	206
2.8.1	Global Least-Squares Smoothing	207
2.8.2	Flux Computations in Heterogeneous Media	208
2.9	Convection-Diffusion Equations	212
2.9.1	A One-Dimensional Model Problem	214

2.9.2	Multi-Dimensional Equations	216
2.9.3	Time-Dependent Problems	218
2.10	Analysis of the Finite Element Method	220
2.10.1	Weak Formulations	221
2.10.2	Variational Problems	223
2.10.3	Results for Continuous Problems	226
2.10.4	Results for Discrete Problems	232
2.10.5	A Priori Error Estimates	238
2.10.6	Numerical Experiments	241
2.10.7	Adaptive Finite Element Methods	243
3	Programming of Finite Element Solvers	251
3.1	A Simple Program for the Poisson Equation	252
3.1.1	Discretization	252
3.1.2	Basic Parts of a Simulator Class	253
3.2	Increasing the Flexibility	261
3.2.1	A Generalized Model Problem	262
3.2.2	Using the Menu System	262
3.2.3	Creating the Grid Object	266
3.3	Some Visualization Tools	268
3.3.1	Storing Fields for Later Visualization	269
3.3.2	Filtering Simres Data	269
3.3.3	Visualizing Diffpack Data in Plotmtv	272
3.3.4	Visualizing Diffpack Data in Gnuplot	276
3.3.5	Visualizing Diffpack Data in Matlab	277
3.3.6	Visualizing Diffpack Data in Vtk	277
3.3.7	Visualizing Diffpack Data in IRIS Explorer	279
3.3.8	Plotting Fields along Lines	280
3.4	Some Useful Diffpack Features	281
3.4.1	The Menu System	281
3.4.2	Multiple Loops	284
3.4.3	Computing Numerical Errors	285
3.4.4	Functors	286
3.4.5	Computing Derivatives of Finite Element Fields	288
3.4.6	Specializing Code in Subclass Solvers	292
3.5	Introducing More Flexibility	294
3.5.1	Setting Boundary Condition Information in the Grid	295
3.5.2	Line and Surface Integrals	301
3.5.3	Simple Mesh Generation Tools	304
3.5.4	Grid Generation by Super Elements	310
3.5.5	Debugging	315
3.5.6	Automatic Report Generation	318
3.5.7	Specializing Code in Subclass Solvers	320
3.5.8	Overriding Menu Answers in the Program	325
3.5.9	Estimating Convergence Rates	328
3.5.10	Axisymmetric Formulations and Cartesian 2D Code	331

3.5.11	Summary	333
3.6	Step-by-Step Development of a Diffpack Solver	334
3.6.1	Physical and Mathematical Problem	334
3.6.2	Editing and Writing Source Code	336
3.6.3	A Simplified Test Case	344
3.6.4	Creating the Grid	349
3.6.5	Running Some Initial 2D Simulations	353
3.6.6	Running Real Simulations	359
3.7	Adaptive Grids	361
3.7.1	Grid Classes with Local Mesh Refinements	363
3.7.2	How to Extend an Existing Simulator	364
3.7.3	Organization of Refinement Criteria	366
3.7.4	Grid Refinements as a Preprocessor	371
3.7.5	Example: Corner-Flow Singularity	373
3.7.6	User-Defined Refinement Criteria	375
3.7.7	Transient Problems	375
3.8	Projects	379
3.8.1	Flow in an Open Inclined Channel	379
3.8.2	Stress Concentration due to Geometric Imperfections	381
3.8.3	A Poisson Problem with Pure Neumann Conditions	382
3.8.4	Lifting Airfoil	384
3.9	A Convection-Diffusion Solver	386
3.10	A Heat Equation Solver	390
3.10.1	Discretization	390
3.10.2	Implementation	391
3.11	A More Flexible Heat Equation Solver	397
3.11.1	About the Model Problem and the Simulator	398
3.11.2	Variable Time Step Size	399
3.11.3	Applying a Transient Solver to a Stationary PDE	400
3.11.4	Thermal Conditions During Welding	400
3.12	Visualization of Time-Dependent Fields	401
3.12.1	Filtering Time-Dependent Simres Data	401
3.12.2	Storing Fields at Selected Time Points	402
3.12.3	Time Series at Selected Spatial Points	403
3.12.4	Using ImageMagick Tools	404
3.12.5	Animation Using Plotmtv	406
3.12.6	Animation Using Vtk	407
3.12.7	Animation Using Matlab	408
3.12.8	Real-Time Visualization	408
3.12.9	Handling Simulation and Visualization from a Script	410
3.12.10	Heat Transfer Exercises	414
3.13	A Transient Heat Transfer Application	416
3.13.1	The Mathematical and Physical Model	416
3.13.2	Implementation	418
3.13.3	Testing and Debugging the Initial State	424

3.13.4	Creating the Grid	425
3.13.5	Running Time-Dependent Simulations	427
3.13.6	A Scripting Interface for Automating Simulations	432
3.14	Projects	442
3.14.1	Transient Heat Transfer in a Two-Material Structure	442
3.14.2	Transient Flow with Non-Circular Cross Section	443
3.14.3	Transient Groundwater Flow	445
3.15	Efficient Solution of the Wave Equation	446
3.15.1	Discretization	446
3.15.2	Implementation	447
3.15.3	Extensions of the Model Problem	451
3.15.4	Flexible Representation of Variable Coefficients	452
4	Nonlinear Problems	459
4.1	Discretization and Solution of Nonlinear PDEs	459
4.1.1	Finite Difference Discretization	459
4.1.2	Finite Element Discretization	460
4.1.3	The Group Finite Element Method	462
4.1.4	Successive Substitutions	464
4.1.5	Newton-Raphson's Method	464
4.1.6	A Transient Nonlinear Heat Conduction Problem	470
4.1.7	Iteration Methods at the PDE Level	473
4.1.8	Continuation Methods	476
4.2	Software Tools for Nonlinear Finite Element Problems	477
4.2.1	A Solver for a Nonlinear Heat Equation	477
4.2.2	Extending the Solver	483
4.3	Projects	487
4.3.1	Operator Splitting for a Reaction-Diffusion Model	487
4.3.2	Compressible Potential Flow	489
5	Solid Mechanics Applications	493
5.1	Linear Thermo-Elasticity	494
5.1.1	The Physical and Mathematical Model	494
5.1.2	A Finite Element Method	497
5.1.3	Engineering Finite Element Notation	499
5.1.4	Implementation	502
5.1.5	Examples	510
5.1.6	Elastic Vibrations	518
5.2	Elasto-Viscoplasticity	522
5.2.1	Basic Physical Features of Elasto-Viscoplasticity	522
5.2.2	A Three-Dimensional Elasto-Viscoplastic Model	525
5.2.3	Simplification; a Forward Scheme in Time	529
5.2.4	Numerical Handling of Yield Criteria	530
5.2.5	Implementation	533
5.2.6	Examples	534

6	Fluid Mechanics Applications	539
6.1	Convection-Diffusion Equations	539
6.1.1	The Physical and Mathematical Model	539
6.1.2	A Finite Element Method	541
6.1.3	Incorporation of Nonlinearities	541
6.1.4	Software Tools	542
6.1.5	Melting and Solidification	544
6.2	Shallow Water Equations	546
6.2.1	The Physical and Mathematical Model	547
6.2.2	Finite Difference Methods on Staggered Grids	549
6.2.3	Implementation	552
6.2.4	Nonlinear and Dispersive Terms	556
6.2.5	Finite Element Methods	558
6.3	An Implicit Finite Element Navier-Stokes Solver	562
6.3.1	The Physical and Mathematical Model	562
6.3.2	A Finite Element Method	564
6.3.3	Solution of the Nonlinear Systems	566
6.3.4	Implementation	568
6.4	A Classical Finite Difference Navier-Stokes Solver	576
6.4.1	Operator Splitting	576
6.4.2	Finite Differences on 3D Staggered Grids	578
6.4.3	A Multigrid Solver for the Pressure Equation	582
6.4.4	Implementation	582
6.5	A Fast Finite Element Navier-Stokes Solver	586
6.5.1	Operator Splitting and Finite Element Discretization	586
6.5.2	An Optimized Implementation	589
6.6	Projects	591
6.6.1	Analysis of Discrete Shallow Water Waves	591
6.6.2	Approximating the Navier-Stokes Equations by a Laplace Equation	593
7	Coupled Problems	595
7.1	Fluid-Structure Interaction; Squeeze-Film Damping	595
7.1.1	The Physical and Mathematical Model	595
7.1.2	Numerical Methods	601
7.1.3	Implementation	603
7.2	Fluid Flow and Heat Conduction in Pipes	611
7.2.1	The Physical and Mathematical Model	611
7.2.2	Numerical Methods	615
7.2.3	Implementation	619
7.3	Projects	626
7.3.1	Transient Spherical-Symmetric Thermo-Elasticity	626
7.3.2	Transient 2D/3D Thermo-Elasticity	629
7.3.3	Convective-Diffusive Transport in Viscous Flow	630
7.3.4	Chemically Reacting Fluid	631

A	Mathematical Topics	633
A.1	Scaling and Dimensionless Variables	633
A.2	Indicial Notation	641
A.3	Compact Notation for Difference Equations	643
A.4	Stability and Accuracy of Difference Approximations	646
A.4.1	Typical Solutions of Simple Prototype PDEs	646
A.4.2	Physical Significance of Parameters in the Solution	649
A.4.3	Analytical Dispersion Relations	650
A.4.4	Solution of Discrete Equations	653
A.4.5	Numerical Dispersion Relations	656
A.4.6	Convergence	657
A.4.7	Stability	658
A.4.8	Accuracy	659
A.4.9	Truncation Error	662
A.4.10	Traditional von Neumann Stability Analysis	665
A.4.11	Examples: Analysis of the Heat Equation	666
A.5	Exploring the Nature of Some PDEs	670
A.5.1	A Hyperbolic Equation	670
A.5.2	An Elliptic Equation	674
A.5.3	A Parabolic Equation	674
A.5.4	The Laplace Equation Solved by a Wave Simulator	677
A.5.5	Well-Posed Problems	680
B	Diffpack Topics	681
B.1	Brief Overview of Important Diffpack Classes	681
B.2	Diffpack-Related Operating System Interaction	686
B.2.1	Unix	686
B.2.2	Windows	689
B.3	Combining Diffpack with Other Types of Software	695
B.3.1	Calling Other Software Packages from Diffpack	695
B.3.2	Calling Diffpack from Other Types of Software	699
B.4	Basic Diffpack Features	700
B.4.1	Diffpack Man Pages	700
B.4.2	Standard Command-Line Options	701
B.4.3	Generalized Input and Output	703
B.4.4	Automatic Verification of a Code	707
B.5	Visualization Support	708
B.5.1	Curves	709
B.5.2	Scalar and Vector Fields	714
B.6	Details on Finite Element Programming	717
B.6.1	Basic Functions for Finite Element Assembly	717
B.6.2	Using Functors for the Integrands	720
B.6.3	Integrating Quantities over the Grid or the Boundary	721
B.6.4	Class Relations in the Finite Element Engine	724
B.7	Optimizing Diffpack Codes	725
B.7.1	Avoiding Repeated Matrix Factorizations	727

B.7.2	Avoiding Repeated Assembly of Linear Systems	730
B.7.3	Optimizing the Assembly Process	739
B.7.4	Optimizing Array Indexing	744
C	Iterative Methods for Sparse Linear Systems	751
C.1	Classical Iterative Methods	752
C.1.1	A General Framework	753
C.1.2	Jacobi, Gauss-Seidel, SOR, and SSOR Iteration	754
C.2	Conjugate Gradient-Like Iterative Methods	760
C.2.1	Galerkin and Least-Squares Methods	761
C.2.2	Summary of the Algorithms	765
C.2.3	A Framework Based on the Error	767
C.3	Preconditioning	768
C.3.1	Motivation and Basic Principles	768
C.3.2	Classical Iterative Methods as Preconditioners	770
C.3.3	Incomplete Factorization Preconditioners	771
C.4	Multigrid and Domain Decomposition Methods	773
C.4.1	Domain Decomposition	774
C.4.2	Multigrid Methods	775
D	Software Tools for Solving Linear Systems	781
D.1	Storing and Initializing Linear Systems	781
D.1.1	Vector and Matrix Formats	782
D.1.2	Detailed Matrix Examples	788
D.1.3	Representation of Linear Systems	794
D.2	Programming with Linear Solvers	797
D.2.1	Gaussian Elimination	797
D.2.2	A Simple Demo Program	798
D.2.3	A 3D Poisson Equation Solver	800
D.3	Classical Iterative Methods	804
D.4	Conjugate Gradient-like Methods	805
D.4.1	Symmetric Systems	805
D.4.2	Nonsymmetric Systems	806
D.5	Preconditioning Strategies	807
D.6	Convergence History and Stopping Criteria	811
D.7	Example: Implicit Methods for Transient Diffusion	821
D.8	High-Level Stencil Programming of Finite Difference Schemes	823
D.8.1	Finite Difference Stencils	823
D.8.2	Basic Structure of a Stencil-Based Simulator	825
D.8.3	Defining the Stencils	828
	Bibliography	833
	Index	843
