## Contents

1 The Environment of Plants ...................................................... 1  
1.1 The Surroundings of Plants ................................................... 1  
1.2 Radiation and Climate ....................................................... 32  

2 Carbon Utilization and Dry Matter Production ...................... 69  
2.1 Carbon Metabolism in the Cell .............................................. 69  
2.2 Gas Exchange in Plants ....................................................... 91  
2.3 The Carbon Budget of the Whole Plant .................................. 139  
2.4 The Carbon Budget of Plant Stands ....................................... 163  
2.5 Energy Conversion by the Plant Cover ................................... 173  

3 The Utilization of Mineral Elements ........................................ 185  
3.1 The Soil as a Nutrient Source for Plants ................................. 185  
3.2 The Uptake of Mineral Nutrients ......................................... 186  
3.3 Utilization and Deposition of Minerals in the Plant .................. 193  
3.4 The Elimination of Minerals ................................................. 202  
3.5 Nitrogen Metabolism ......................................................... 203  
3.6 Habitat-Related Aspects of Mineral Metabolism ..................... 211  
3.7 Mineral Cycling in Plant Communities .................................... 224  

4 Water Relations ................................................................. 231  
4.1 Poikilohydric and Homoiohydric Plants ................................. 231  
4.2 Water Relations of Plant Cells ............................................. 233  
4.3 Water Relations of the Whole Plant ...................................... 239  
4.4 Water Relations in Plant Communities ................................... 286  

5 Environmental Influences on Growth and Development .......... 297  
5.1 Regulation of Growth and Development .................................. 298  
5.2 Developmental Stages of the Plant Life Cycle ......................... 307  
5.3 The Seasonality of Growth and Development ......................... 324  
5.4 Phenology: Plant Development as an Indicator of Weather Characteristics and Climate Changes ................................. 329
6 Plants Under Stress ................................................................. 345
   6.1 Stress: Disturbance and Syndrome .................................... 345
   6.2 Solar Radiation Stress ...................................................... 357
   6.3 Stress Due to Extreme Temperatures .................................. 364
   6.4 Oxygen Deficiency .......................................................... 396
   6.5 Drought ............................................................................. 401
   6.6 Salt Stress .......................................................................... 416
   6.7 Excess of Heavy Metals ..................................................... 428
   6.8 Pollutants and Their Impact on the Phytosphere ..................... 437

References .................................................................................. 451

References within the Boxes ....................................................... 494

Subject Index ............................................................................. 505

Boxes
Box 1.1 M. Küppers: Space Filling by Foliage: The Effect of
   Growth Form and Architecture on the Light Environment .......... 40
Box 1.2 M. Küppers: Space Filling by Foliage: Simulation of
   Crown Architectural Growth as a Factor in Competition ............. 45
Box 2.1 U. Schreiber: In Vivo Chlorophyll Fluorescence:
   Assessment and Analysis of Photosynthesis Function .................. 73
Box 2.2 A.J.E. van Bel: Phloem Transport:
   The Collective Power of Single Modules .................................... 151
Box 2.3 Ch. Körner: Atmospheric CO2 Enrichment:
   an Ecological Perspective ......................................................... 177
Box 3.1 J.F. Ma: Aluminum Tolerance in Plants ............................. 218
Box 4.1 E. Steudle: Uptake of Water by Plant Roots ......................... 247
Box 4.2 H. Richter: Long Distance Transport of Water
   in Plants and the Cohesion Theory ............................................ 254
Box 5.1 R. Borchert: Environmental Control of
   Vegetative Phenology in Tropical Dry Forest Trees ...................... 337
Box 6.1 B. Demmig-Adams, W.W. Adams III:
   Photoprotection Against Excess Light Via
   Zeaxanthin-Dependent Energy Dissipation .................................. 359
Box 6.2 L. Kappen, B. Schroeter: Surviving in the Cold:
   How Lichens Cope with the
   Environmental Conditions in Polar Regions ............................. 369
Box 6.3 W.H.O. Ernst: Evolution of Adaptation Mechanism
   of Plants on Metal-Enriched Soils ............................................ 433
Physiological Plant Ecology
Ecophysiology and Stress Physiology of Functional Groups
Larcher, W.
2003, XX, 514 p., Hardcover
ISBN: 978-3-540-43516-7
