I. Threats to Plant Population Viability

1 Why Plant Population Viability Assessment? .............................................. 3
   M.W. SCHWARTZ and C.A. BRIGHAM

   1.1 Introduction ...................................................................................... 3
   1.1.1 Book Structure ............................................................................ 4
   1.2 Why Plants Differ ............................................................................ 6
   1.3 Life Histories of Plants ..................................................................... 8
   1.4 Conclusion: Conservation Challenges for Plants ......................... 11
   References .............................................................................................. 13

2 Threats to Rare Plant Persistence ................................................................. 17
   J.G.B. OOSTERMEIJER

   2.1 Introduction ...................................................................................... 17
   2.2 Delineating Different Types of Threats ........................................... 18
      2.2.1 Environmental Threats ............................................................... 19
         2.2.1.1 Climate Change ..................................................................... 19
         2.2.1.2 Habitat Fragmentation and Degradation ............................ 22
         2.2.2 Disturbed Biotic Interactions ..................................................... 24
            2.2.2.1 Pollen Limitation ............................................................... 24
            2.2.2.2 Dispersal Limitation ............................................................ 24
            2.2.2.3 Interactions with Exotic Species .................................... 25
            2.2.2.4 Climate Change ................................................................. 26
            2.2.2.5 Grazing and Trampling ...................................................... 26
            2.2.2.6 Climate Change ................................................................. 26
         2.2.3 Genetic Threats .......................................................................... 27
            2.2.3.1 Drift and Inbreeding .......................................................... 27
            2.2.3.2 Inbreeding Effects ............................................................. 28
            2.2.3.3 Loss of S-alleles ................................................................. 28
            2.2.3.4 Reduced Adaptability ....................................................... 29
3 Factors Affecting Persistence in Formerly Common and Historically Rare Plants

C.A. Brigham

3.1 Introduction ......................................................... 63
3.1.1 General Background .......................................... 63
3.1.2 Selection of Factors ........................................... 65
3.1.3 Types of Rarity in Plants ...................................... 65
3.2 Reductions in Genetic Diversity ................................. 66
3.2.1 Is There a Positive Correlation Between Genetic Diversity and Population Size in Plants? ........ 67
3.2.2 Do Rare Plant Species Show Reduced Genetic Diversity in Comparison to More Common Congeners? .... 71
3.2.3 Is There Evidence for a Positive Correlation Between Reduced Genetic Diversity and Reduced Fitness in Plants? .... 73
3.2.4 Do Historically Rare and Formerly Common Species Show Similar Patterns of Correlations Between Population Size and Genetic Diversity? ........ 76
3.2.5 Implications for PVAs ........................................... 78
3.3 Competition ......................................................... 79
3.3.1 Is There Evidence for Competition with Native Species as a Cause of Rarity in Plants? ........ 80
3.3.2 What Is the Role of Exotic Species in Plant Declines? .... 83
3.3.3 Competition in Historically Rare and Formerly Common Species .......................... 84
3.3.4 Implications for PVA .................................. 85
3.4 Loss of Pollinators at Low Abundance .................................................. 86
3.4.1 Are Rare Plants in General Pollinator-Limited? ................................. 86
3.4.2 How Might We Expect Plant-Pollinator Relationships to Differ for Historically Rare and Formerly Common Species? .............................. 88
3.4.3 Implications for PVA .................................. 89
3.5 Herbivory and Seed Predation ................................................................. 90
3.5.1 Review of the Evidence for Effects of Herbivory and Seed Predation on Rare Plants ................................................. 90
3.5.2 Historically Rare vs. Formerly Common Species: Expectations ................. 91
3.5.3 Implications for PVA .................................. 94
3.6 Conclusions .......................................................... 95
3.6.1 Suggestions for Future Directions .......................................................... 96
3.6.2 Implications for PVA .................................. 97
References ............................................................................................. 98

4 The Relationship Between Plant-Pathogen and Plant-Herbivore Interactions and Plant Population Persistence in a Fragmented Landscape . 105
N.J. Ouborg and A. Biere

4.1 Introduction .......................................................... 105
4.2 Effects of Habitat Fragmentation on Species Interactions ......... 106
4.3 The Interaction Between Plants and Diseases and Herbivores ................................................. 107
4.4 Habitat Fragmentation and Disease Susceptibility ................. 109
4.4.1 Disease Incidence and Genetic Drift ................................................. 110
4.4.2 Disease Incidence and Inbreeding ................................................. 111
4.4.3 Disease Incidence and Population Dynamics: Thresholds ........ 114
4.4.4 Disease Incidence and Multitrophic Interactions ................. 116
4.5 Conclusions .......................................................... 118
References ............................................................................................. 119
5 The Origin and Extinction of Species
Through Hybridization .......................... 125
C.A. Buerkle, D.E. Wolf and L.H. Riesenberg

5.1 Introduction: Consequences of Hybridization .......... 125
5.1.1 Maintenance of Stable Hybrid Zones .......... 126
5.1.2 Extinction Through Hybridization with Congeners .... 128
5.1.3 Hybrid Speciation and Adaptive Trait Introgression ... 132
5.2 The Relative Frequency Of Extinction, Homoploid Speciation and Other Consequences of Hybridization ... 136
5.2.1 Methods ........................................... 136
5.2.2 Results ............................................ 137
5.2.3 Discussion ....................................... 138
5.3 Frequency of Outcomes: Overview ........................ 139
5.4 Species Conservation Among Hybridizing Taxa .......... 143
5.4.1 Anthropogenic Disturbance and Hybridization ...... 144
5.4.2 Conclusion: Implications for Population Viability Analysis and Management .................. 145
References ............................................. 147

II. Modeling Approaches for Population Viability Analysis

6 Approaches to Modeling Population Viability In Plants:
An Overview ......................................... 155
C.A. Brigham and D.M. Thomson

6.1 Introduction ........................................ 155
6.2 Unstructured Models ................................ 157
6.2.1 The Diffusion Approximation .................. 157
6.2.2 When to Use Unstructured Models ............. 160
6.3 Stage-Structured Models ............................ 161
6.3.1 Developing a Matrix Model ..................... 163
6.3.2 Sensitivity and Elasticity Analysis .............. 166
6.3.3 When to Use Stage-Structured Models ......... 168
6.4 Spatially Structured Models .......................... 169
6.4.1 Metapopulation Models ......................... 170
6.4.2 Spatially Structured Matrix Models ............. 173
6.4.3 When to Use Spatially Structured Models ...... 174
6.5 Genetics in Population Viability Analysis ............ 175
6.6 Future Directions .................................. 176
6.7 Conclusions ...................................... 178
References ............................................. 178
The Problems and Potential of Count-Based Population Viability Analyses

B.D. Elderd, P. Shahani, and D.F. Doak

III. Addressing Plant Life Histories in Population Viability Analysis

9 Assessing Population Viability in Long-Lived Plants 255
M.W. Schwartz

9.1 Introduction 255
9.2 Strategies for Population Viability Analysis 256
9.2.1 Population Trend Assessment 258
9.2.2 Transition Matrix Modeling 260
9.2.2.1 Insufficient Sampling Interval 261
9.2.2.2 Inaccurate Transition Probabilities and Complex Transitions 263
9.2.2.3 Transition Matrix Element Elasticity 265
9.2.3 Reconstructing Performance from Population Size Structure 267
9.2.4 Predicting Community Dynamics 269
9.2.5 Sample Variance 270
9.3 Expressing Viability: Extinction Likelihood/Generation Time 271
9.4 Nonquantitative Assessments of Viability 271
9.4.1 Habitat Loss 274
9.4.2 Disturbance Regime 275
9.4.3 Habitat Degradation 277
9.4.4 Population Performance 277
9.4.5 Obtaining Expert Opinion 278
9.4.6 Estimating Habitat Area Requirements 278
9.5 Conclusions 279
