Contents

Measurement principles for traceability in chemical analysis ........................................ 1
Protocols for traceability in chemical analysis. Part I: Definitions and terminology .......... 12
Protocols for traceability in chemical analysis. Part II: Design and use .......................... 24
Metrological traceability in laboratory medicine ...................................................... 29
Traceability and analytical chemistry ................................................................. 36
Do interlaboratory comparisons provide traceability? .............................................. 45
From total allowable error via metrological traceability to uncertainty of measurement of the unbiased result .... 50
Practical considerations on the traceability to conventional scales .............................. 55
Traceability of (values carried by) reference materials .............................................. 64
What can we learn from traceability in physical measurements? .................................. 70
How to achieve international comparability for chemical measurements .................. 74
The key elements of traceability in chemical measurement: agreed or still under debate? ........ 79
The practical realization of the traceability of chemical measurements standards ............ 85
Link to the SI via primary direct methods .............................................................. 93
The role of reference materials ................................................................................. 97
The measurement assurance concept in calibration and traceability at NBS/NIST ........ 102
Lifetime of the traceability chain in chemical measurement ........................................ 105
Proficiency evaluation as a traceability link in chemical metrology ............................... 109
Achieving traceability in chemical measurement – a metrological approach to proficiency testing .... 114
Traceability issues in measurement ........................................................................ 121
Comparative study of the presentations at the CCQM workshop on traceability ............. 125
Traceability in laboratory medicine .......................................................................... 128
Testing for foods derived from modern biotechnology: opportunities and limitations for metrology ........ 134
A national traceability system for chemical measurements ......................................... 141
Establishing measurement traceability in clinical chemistry ........................................ 147
Clinical laboratory reference networks ........................................................................ 160
One way of disseminating reference values with demonstrated traceability and demonstrated uncertainty to field laboratories: IMEP ......................................................... 166
Implementation of traceability – needs and perspective of the in-vitro-diagnosticum industry ........................................................ 175
Improvements in efficiency of production and traceability for certification of reference materials ........................................................ 177
Traceable measurement in clinical laboratories .......................................................... 184
A traceability protocol to the SI by gravimetric analysis .............................................. 192
Reference samples for analysis of gas impurities in aluminium and titanium alloys: Features of production, certification and usage to ensure traceability of results ........................................................ 195
The use of certified reference materials in the Romanian traceability scheme ............... 199
Traceable measurements of pH ................................................................................. 206
The development of gas standards and calibration techniques for measurements of vehicle, aircraft and industrial emissions, natural gas, occupational exposure and air quality ........................................................ 212
Problems of traceability of total protein and catecholamine determinations in human urine .......... 222
Traceability in routine chemical measurements: an example of application in the determination of CO₂ at atmospheric concentration ........................................... 226

Traceability of measurement results of the effective acquisition time in gamma-ray spectrometry implemented by the pulser method ............................ 230

Practical ways in establishing traceability in chemical and other measurements in Mexico .................. 239

Benefits of the implementation of a metrological structure for water analyses ................................. 245

Validation steps for traceability of linear calibrated chemical measurements .................................... 253

Traceability, is it what we really want in our chemical measurements? .............................................. 259

Traceability in measurement – time for an update? ..... 260

On the existence of primary methods of measurement ........................................................................... 262

Traceability and uncertainty – A comparison of their application in chemical and physical measurement ................................................................. 264

Traceability and its role in interlaboratory comparisons (proficiency testing programmes), modeled on trace element determination in biological materials ........ 267

Traceable property values of in-house reference materials ................................................................. 269

Primary reference materials and traceability chain for gas composition ........................................... 272

Traceability to units .................................................. 275

Traceability without uncertainty: current situation in pharmaceutical industry ................................. 277

The role of reference materials in analytical chemistry ..................................................... 279

Meeting ISO/IEC 17025 Traceability Requirements: A New Guide with Worked Examples .................. 284

UK delivery of traceable chemical measurements in the 21st century: building on the foundation of the VAM programme .............................................. 287

Disseminating traceability in chemical measurement: Principles of a new EURACHEM/CITAC guide .... 290

CITAC Position Paper: Traceability in chemical measurement ......................................................... 293

Glossary of analytical terms ....................................... 295
Traceability in Chemical Measurement
De Bièvre, P.; Günzler, H. (Eds.)
2005, XII, 300 p., Hardcover
ISBN: 978-3-540-43989-9
