# Preface ................................................ XII

## 1 Contractional theory, continental drift and plate tectonics .......................... 1

Plate tectonics – a change in the paradigm of the geosciences ........................................ 1
Early history of geodynamic thought .................................................. 1
From continental drift to plate tectonics ................................................. 2
The plate tectonic concept .............................................................. 4
The pattern of magnetic polarity stripes ................................................. 8
Plate motions and earthquake zones .................................................... 8
Two kinds of continental margins ....................................................... 11
Magmatism and plate tectonics .......................................................... 11
What drives the plates and what slows them down? .................................. 12
Collision and mountain building ........................................................ 12

## 2 Plate movements and their geometric relationships ................................. 15

Helpful transform faults ................................................................. 15
Relative movements and triple junctions ............................................. 16
*Two RTF triple junctions off North America* ....................................... 18
Relative plate velocities – past and present ......................................... 20
Direct measurement of plate movements ............................................ 21
Apparent contradictions in the plate motion pattern ............................. 22
*Fault-plane-solutions of earthquakes* ............................................... 23
*Seismic tomography* ................................................................. 25

## 3 Continental graben structures ......................................................... 27

*Active and passive graben structures* ............................................... 28
Symmetric and asymmetric crustal extension ...................................... 28
Sediments and ore deposits in graben structures .................................. 29
Volcanism in graben structures .......................................................... 30
The Upper Rhine Graben in Germany ................................................. 31
The history of the Upper Rhine Graben .............................................. 32
*The Upper Rhine Graben in the Middle European stress field* ............... 33
Magmatism and heat flow in the Upper Rhine Graben ............................. 34
The large East African rift system ..................................................... 34
*The Afar Depression* ................................................................. 37
The Red Sea – from rift to drift ........................................................ 37
The extensional area of the Basin and Range Province ........................... 39
The development of metamorphic domes ........................................... 40
A brief history of the Basin and Range Province .................................. 41

## 4 Passive continental margins and abyssal plains ................................ 43

Continuous subsidence of the continental margins ............................... 43
The sedimentary trap at a passive continental margin ............................ 44
*Tracts of sequence stratigraphy* ..................................................... 45
Processes on continental margins ..................................................... 46
Petroleum deposits – the economic significance of passive continental margins .............................................. 48
The Atlantic – an ocean opens in an intricate manner ............................. 48
*Pangaea and Panthalassa* .......................................................... 49
The large abyssal plains ............................................................... 51
Sediments of the abyssal plains ....................................................... 52
*Manganese nodules from the deep sea* ........................................ 54
Facies changes on the large oceanic conveyor belt .................................. 55
*The Bengal deep sea fan* .......................................................... 56
### Transform faults

- Oceanic transform faults
- Fracture zones in the ocean floor
- Continental transform faults
- San Andreas – the infamous transform fault of California
- The North Anatolian Fault in Asia Minor
- The Alpine Fault in New Zealand

### Terranes

- Documenting terranes
- Terranes in the North American Cordillera
- Suspect terranes in Mexico and Middle America

### Early Precambrian plate tectonics

- The oldest rocks and minerals
- Greenstone-granite belts
- Granite-gneiss belts
- Komatiites
- Towards an Archean plate tectonic model
- The growth of continents
- Possible younger equivalents of greenstone-granite belts
- The Great Dike of Zimbabwe

### Old orogens

- 2500–2000 million years old ophiolites
- The Wopmay orogen in Canada
- The Grenville orogenic cycle and the formation of the supercontinent Rodinia
- The Panfrican orogeny and the formation of Gondwana
- The Caledonides – a Wilson cycle around the Iapetus Ocean
  - The significance of Scotland and the Greek mythology
- The Variscides – a broad mountain belt in central Europe
  - A Variscan suture in the southern Black Forest
- The Variscan orogen in the Alps
- Paleozoic mountain building in eastern and southern North America
  - How many orogenies?

### Young orogens – the Earth’s loftiest places

- The Himalayas – a mountain range with superlatives
- Tectonic history of the Himalayas
  - Nanga Parbat and Namche Barwa syntaxis
- The Alps – an untypical but classic orogen
- Brief history of Alpine evolution
  - Lateral tectonic extrusion in the Alps
- The North American Cordillera
  - a different style of orogen
- Laramide Rocky Mountains – an orogenic mystery solved
- Epilog

### Glossary
