Contents

1 Calculation of Roundabouts: Problem Definition ................. 1
  1.1 Statistical Equilibrium and Steady-State Conditions ......... 2
    1.1.1 A Worked Example on Traffic Demand at a Roundabout ... 4
  1.2 Capacity and Capacity Indices ................................ 7
  1.3 Delays and Queue Lengths ..................................... 9
References .......................................................... 13

2 Capacity Evaluation ................................................. 15
  2.1 Capacity Calculation at Steady-State Conditions ............. 15
    2.1.1 Brilon-Bondzio Formula (Germany) ...................... 17
    2.1.2 Bovy et al. Formula (Switzerland) ....................... 19
    2.1.3 TRRL Formula (United Kingdom) ......................... 22
    2.1.4 GIRABASE Formula (France) ............................. 27
    2.1.5 Brilon-Wu Formula (Germany) ............................ 32
    2.1.6 HCM 2000 Formula (USA) ............................... 34
  2.2 Exit and Circle Capacities .................................... 36
  2.3 Consideration of Pedestrian Crosswalks ....................... 36
    2.3.1 Entry Capacities in Presence of Pedestrian Crosswalks ... 37
    2.3.2 Exit Capacities in Presence of Pedestrian Crosswalks ... 44
  2.4 Some Concluding Remarks on Capacity Formulations .......... 44
  2.5 Capacity Calculation at Saturation or Oversaturation
    Conditions of Entries ......................................... 46
    2.5.1 A Worked Example ........................................ 47
  2.6 Calculation Procedures for Simple Capacity
    and Total Capacity ............................................ 52
    2.6.1 A Worked Example ........................................ 54
References .......................................................... 56

3 Waiting Phenomena at Steady State and Non-steady
  State Conditions .................................................. 59
  3.1 Some Results of Probabilistic Analysis of Queues ............ 60
    3.1.1 Some Remarkable Results ................................ 61
    3.1.2 Concluding Remarks ...................................... 65
3.2 Deterministic Analysis of Queues .............................................. 67
  3.2.1 A Worked Example .......................................................... 70
  3.2.2 Some Remarkable Results ................................................. 74
  3.2.3 Further Expressions of the Average Waiting Times .................. 86
  3.2.4 Concluding Remarks ...................................................... 87
3.3 Time-Dependent Solutions and Waiting Phenomena ....................... 88
  3.3.1 Time-Dependent Solutions for the Number of Users in the System and in the Queue. A Worked Example .... 91
  3.3.2 Time-Dependent Solutions for the Average Time Spent in the System and in the Queue. A Worked Example 94
  3.3.3 Generalized Time-Dependent Solutions ................................ 97
  3.3.4 Time-Dependent Solutions for Traffic Peaks Between Two Periods at Steady-State Conditions ............. 98
  3.3.5 Concluding Remarks ...................................................... 104
References ................................................................................. 105

4 Calculation of Waiting Times, Queue Lengths, and Levels of Service ...................................................... 107
  4.1 State Evolutions with Undersaturated Entries .......................... 107
    4.1.1 First Worked Example ...................................................... 111
    4.1.2 Second Worked Example ................................................... 116
  4.2 State Evolution with Saturated or Oversaturated Entries ............ 121
    4.2.1 First Worked Example ...................................................... 123
    4.2.2 Second Worked Example ................................................... 132
  4.3 Evaluation of Levels of Service ............................................. 134
References ................................................................................. 137

5 Evaluation of Roundabout Reliability ........................................ 139
  5.1 Reliability and Performance Functions ..................................... 140
  5.2 General Calculation Procedure of Reliability ............................ 143
    5.2.1 A Worked Example .......................................................... 145
  5.3 Approximated Calculation Procedure of Reliability .................... 151
    5.3.1 A Worked Example .......................................................... 153
  5.4 Some Remarks ................................................................. 154
References ................................................................................. 156

Index .......................................................................................... 157
Calculation of Roundabouts
Capacity, Waiting Phenomena and Reliability
Mauro, R.
2010, XII, 155 p., Hardcover
ISBN: 978-3-642-04550-9
