## Contents

1 Introduction ................................................................ 1

2 Model Formulation ........................................................ 9
   2.1 The Verhulst Model for Population Growth .................. 9
   2.2 The SIS Model for Spread of Infection Without Immunity .. 12
   2.3 A Contact Process on a Complete Graph ................. 14
   2.4 Some Early Stochastic Logistic Models ......................... 14
   2.5 Parameter Spaces ..................................................... 15

3 Stochastic Process Background .......................................... 17
   3.1 Formulation of a Birth–Death Process ......................... 18
   3.2 Two Auxiliary Processes ............................................. 19
   3.3 The Quasi-stationary Distribution q ......................... 20
   3.4 The Time to Extinction ............................................... 25
   3.5 Ordering Relations Between Probability Vectors ........... 29
   3.6 Three Basic Properties of the Map Ψ .......................... 31
   3.7 The Stationary Distribution p(0) is a Lower Bound of the Quasi-stationary Distribution q ......................... 34
   3.8 The Stationary Distribution p(1) is an Upper Bound of the Quasi-stationary Distribution q for the SIS Model ................. 36
   3.9 Monotonicity of Two Expressions for the SIS Model .......... 38

4 The SIS Model: First Approximations
   of the Quasi-stationary Distribution ................................. 41

5 Some Approximations Involving the Normal Distribution ......... 47
   5.1 Approximations of the Normal Density Function φ
       and of Its Reciprocal φ* at the Argument ğ(k + x) ............... 50
5.2 Approximations of the Normal Distribution Function $\Phi$ and of the Integral $\Phi^*$ of the Reciprocal of the Normal Density Function at the Argument $\hat{y}(k + x)$ .................... 51
5.3 Approximations of the Ratios $\Phi/\varphi$ and $\Phi^*/\varphi^*$ ..................... 53
5.4 An Approximation of a Sum of Normal Densities ........................................ 57
5.5 An Approximation of a Sum of Reciprocals of Normal Densities ...................... 66
5.6 On the Cox Continuity Correction .............................................................. 71

6 preparations for the Study of the Stationary Distribution $p^{(1)}$ of the SIS Model .............................................................. 73
6.1 A General Approximation of $\rho_n$ ..................................................... 73
6.2 Three Specific Approximations of $\rho_n$ ............................................... 79
6.3 Approximations of $\sum_{n=1}^{N} \rho_n$ ..................................................... 81
   6.3.1 Approximation of $\sum_{n=1}^{N} \rho_n$ for $R_0 > 1$ ...................... 84
   6.3.2 Approximation of $\sum_{n=1}^{N} \rho_n$ for $R_0 < 1$ ...................... 87
   6.3.3 Approximation of $\sum_{n=1}^{N} \rho_n$ in the Transition Region ...... 89

7 Approximation of the Stationary Distribution $p^{(1)}$ of the SIS Model .............................................................. 93
7.1 Approximation of the Stationary Distribution $p^{(1)}$ when $R_0$ is Distinctly Above One ........................................ 93
7.2 Approximation of the Stationary Distribution $p^{(1)}$ when $R_0$ is Distinctly Below One ........................................ 94
7.3 Reparametrization of $R_0$ in the Transition Region .......................... 96
7.4 Approximation of the Stationary Distribution $p^{(1)}$ in the Transition Region ................................................. 98

8 Preparations for the Study of the Stationary Distribution $p^{(0)}$ of the SIS Model .............................................................. 101
8.1 Approximation of $\pi_n$ ............................................................................ 101
8.2 Approximations of $\sum_{n=1}^{N} \pi_n$ ..................................................... 103
   8.2.1 Approximation of $\sum_{n=1}^{N} \pi_n$ for $R_0 > 1$ ........................ 104
   8.2.2 Approximation of $\sum_{n=1}^{N} \pi_n$ for $R_0 < 1$ ....................... 106
   8.2.3 Approximation of $\sum_{n=1}^{N} \pi_n$ in the Transition Region ...... 107

9 Approximation of the Stationary Distribution $p^{(0)}$ of the SIS Model .............................................................. 115
9.1 Approximation of the Stationary Distribution $p^{(0)}$ when $R_0$ is Distinctly Above One ........................................ 115
9.2 Approximation of the Stationary Distribution $p^{(0)}$ when $R_0$ is Distinctly Below One ........................................ 117
9.3 Approximation of the Stationary Distribution $p^{(0)}$ in the Transition Region ................................................. 117
10 Approximation of Some Images Under $\Psi$ for the SIS Model .......................................................... 119
  10.1 Approximations of $\Psi(p^{(1)})$ and $\Psi(p^{(0)})$ when $R_0$ is Distinctly Above One ..................... 120
  10.2 Approximation of $\Psi(p^{(1)})$ when $R_0$ is Distinctly Below One ........................................ 127
  10.3 Approximation of $\Psi(p^{(1)})$ in the Transition Region .................................................. 130
  10.4 Approximation of $\Psi(p^{(1)})$ in the Transition Region .................................................. 135

11 Approximation of the Quasi-stationary Distribution $q$ of the SIS Model .................................................. 141
  11.1 Approximation of the Quasi-stationary Distribution $q$ when $R_0$ is Distinctly Above One .................. 141
  11.2 Approximation of the Quasi-stationary Distribution $q$ when $R_0$ is Distinctly Below One .................. 143
  11.3 Approximation of the Quasi-stationary Distribution $q$ in the Transition Region ............................... 145

12 Approximation of the Time to Extinction for the SIS Model .................................................................. 149
  12.1 Approximation of the Time to Extinction when $R_0$ is Distinctly Above One ............................... 149
  12.2 Approximation of the Time to Extinction when $R_0$ is Distinctly Below One ............................... 152
  12.3 Approximation of the Time to Extinction in the Transition Region ............................................ 153

13 Uniform Approximations for the SIS Model ........................................................................... 155
  13.1 Asymptotic Approximations of $H_1, H_0, H$, and $R$ ....................................................... 157
  13.2 Uniform Approximation of the Stationary Distribution $p^{(1)}$ ................................................ 161
  13.3 Uniform Approximation of the Stationary Distribution $p^{(0)}$ ................................................ 163
  13.4 Uniform Approximation of the Quasi-stationary Distribution $q$ ................................................ 166
  13.5 Uniform Approximation of the Time to Extinction .......................................................... 169

14 Thresholds for the SIS Model .................................................................................................. 171

15 Concluding Comments ........................................................................................................... 177

A Notation .......................................................................................................................... 183

B A Maple Module for Numerical Evaluations .............................................................................. 187

References .................................................................................................................................. 195

Index ....................................................................................................................................... 199
Extinction and Quasi-Stationarity in the Stochastic Logistic SIS Model
Nåsell, I.
2011, XI, 199 p. 10 illus. in color., Softcover
