## Contents

### 1 An Introduction to Linear-Scaling Ab Initio Calculations

1.1 The Challenges of Spatial and Electronic Complexity ................................ 1
1.2 Outline of Dissertation .................................................................................. 2
1.3 The Born–Oppenheimer Approximation ....................................................... 5
1.4 Density Functional Theory ........................................................................... 7
1.5 The Kohn–Sham Equations .......................................................................... 10
1.6 Exchange, Correlation and the Local Density Approximation ..................... 13
1.7 Spin-Density Functional Theory ................................................................... 15
1.8 The Pseudopotential Approximation ............................................................ 16
1.9 Periodicity and Brillouin Zone Sampling ...................................................... 20
1.10 The Plane-Wave and Psinc Basis Sets ......................................................... 22
1.11 Density-Matrix Formulation of DFT ............................................................. 25
1.12 Wannier Function and Density-Matrix Localisation .................................... 27
1.13 The ONETEP Method ................................................................................. 29

References ......................................................................................................... 32

### 2 Linear-Scaling DFT + U for Large Strongly-Correlated Systems

2.1 Strongly-Correlated Systems ...................................................................... 37
2.2 The DFT + U Method ..................................................................................... 40
2.3 Framework for Linear-Scaling DFT + U ....................................................... 45
2.4 Variations with Respect to the Density Kernel ............................................. 48
2.5 Variations with Respect to the NGWFs ......................................................... 52
2.6 Variations with Respect to Ionic Positions .................................................. 54
2.7 Scaling Tests on Nickel Oxide Nano-Clusters ............................................. 56
  2.7.1 Computational Methodology ................................................................. 56
  2.7.2 Scaling of Computational Effort for DFT + U .................................... 57
2.8 Concluding Remarks .................................................................................... 60

References ......................................................................................................... 61
3 Projector Self-Consistent DFT + U Using Nonorthogonal Generalised Wannier Functions

3.1 Localised Strongly-Correlated Subspaces
3.2 Methodological Framework
3.3 The Spatial Form of Hydrogenic Subspaces
3.4 Wannier Functions for Localised Subspaces
3.5 The Self-Consistent Projector Method
3.6 Application to Ligated Iron Porphyrins
   3.6.1 Iron Porphyrin Derivatives
   3.6.2 Computational Methodology
   3.6.3 U and Z-Dependence of Magnetic Dipole Moments and Interaction Energies
   3.6.4 Z-Dependence of Subspace Occupancy in FeP and FeP(CO)
   3.6.5 Z-Dependent Kohn–Sham Bandgap of FeP and FeP(CO)
   3.6.6 Z-Dependent Electric Dipole Moments of FeP and FeP(CO)
   3.6.7 Dependence on the Interaction Parameter U
3.7 Convergence of the Projector Self-Consistency Algorithm
3.8 Computational Cost of Projector Self-Consistency
3.9 Forces in Projector Self-Consistent DFT + U
3.10 Concluding Remarks

4 Subspace Representations in Ab Initio Methods for Strongly Correlated Systems

4.1 Motivation
4.2 Nonorthogonal Representations of the Occupancy Matrix
   4.2.1 The “Full” and “On-Site” Representations
   4.2.2 The “Dual” Representation
   4.2.3 Requirement for a Subspace-Localised Hermitian Projection Operator
   4.2.4 The “Tensorial” Representation
4.3 Application to the DFT + U Method
   4.3.1 The Tensorially Invariant DFT + U Functional
   4.3.2 DFT + U Potential and Ionic Forces
   4.3.3 The Case of Orthonormal Hubbard Projectors
   4.3.4 Invariance Under Generalised Löwdin Transforms
4.4 Strongly-Correlated Insulator: Bulk Nickel Oxide
   4.4.1 Computational Methodology
   4.4.2 Occupancies and Magnetic Dipole Moments
   4.4.3 Kohn–Sham Eigenspectra
