Foreword	v
I Additive Group Theory and Non-unique Factorizations <i>Alfred Geroldinger</i>	1
Introduction	3
Notation	5
1 Basic concepts of non-unique factorizations	7
1.1 Arithmetical invariants	9
1.2 Krull monoids	13
1.3 Transfer principles	16
1.4 Main problems in factorization theory	20
2 The Davenport constant and first precise arithmetical results	21
2.1 The Davenport constant	21
2.2 Group algebras	24
2.3 Arithmetical invariants again	29
3 The structure of sets of lengths	35
3.1 Unions of sets of lengths	35
3.2 Almost arithmetical multiprogressions	38
3.3 The characterization problem	42
4 Addition theorems and direct zero-sum problems	45
4.1 The theorems of Kneser and of Kemperman-Scherk	45
4.2 On the Erdős–Ginzburg–Ziv constant $s(G)$ and on some of its variants	48
5 Inverse zero-sum problems and arithmetical consequences	57
5.1 Cyclic groups	57
5.2 Groups of higher rank	70

5.3	Arithmetical consequences	75
	Bibliography	79
	II Sumsets and Structure	
	<i>Imre Z. Ruzsa</i>	87
	Introduction	89
	Notation	91
1	Cardinality inequalities	93
1.1	Introduction	93
1.2	Plünnecke’s method	95
1.3	Magnification and disjoint paths	97
1.4	Layered product	100
1.5	The independent addition graph	101
1.6	Different summands	102
1.7	Plünnecke’s inequality with a large subset	104
1.8	Sums and differences	106
1.9	Double and triple sums	109
1.10	$A + B$ and $A + 2B$	111
1.11	On the non-commutative case	114
2	Structure of sets with few sums	119
2.1	Introduction	119
2.2	Torsion groups	122
2.3	Freiman isomorphism and small models	125
2.4	Elements of Fourier analysis on groups	128
2.5	Bohr sets in sumsets	132
2.6	Some facts from the geometry of numbers	134
2.7	A generalized arithmetical progression in a Bohr set	135
2.8	Freiman’s theorem	138
2.9	Arithmetic progressions in sets with small sumset	139
3	Location and sumsets	141
3.1	Introduction	141
3.2	The Cauchy–Davenport inequality	142
3.3	Kneser’s theorem	143
3.4	Sumsets and diameter, part 1	146
3.5	The impact function	147
3.6	Estimates for the impact function in one dimension	149
3.7	Multi-dimensional sets	152
3.8	Results using cardinality and dimension	154

3.9	The impact function and the hull volume	157
3.10	The impact volume	159
3.11	Hovanskii's theorem	163
4	Density	167
4.1	Asymptotic and Schnirelmann density	167
4.2	Schirelmann's inequality	169
4.3	Mann's theorem	171
4.4	Schnirelmann's theorem revisited	173
4.5	Kneser's theorem, density form	177
4.6	Adding a basis: Erdős' theorem	177
4.7	Adding a basis: Plünnecke's theorem, density form	179
4.8	Adding the set of squares or primes	182
4.9	Essential components	184
5	Measure and topology	185
5.1	Introduction	185
5.2	Raikov's theorem and generalizations	185
5.3	The impact function	187
5.4	Meditation on convexity and dimension	188
5.5	Topologies on integers	191
5.6	The finest compactification	193
5.7	Banach density	194
5.8	The difference set topology	196
	Exercises	199
	Bibliography	207
III	Thematic seminars	211
1	A survey on additive and multiplicative decompositions of sumsets and of shifted sets, Christian Elsholtz	213
1.1	Introduction	213
1.2	Part I	214
1.2.1	Multiplicative decompositions of sumsets	214
1.2.2	Multiplicative decompositions of shifted sets	216
1.2.3	Some background from sieve methods	217
1.2.4	Proof of Theorem ??	219
1.3	Part II	222
1.3.1	Sumsets	222
1.3.2	Counting methods	222
1.3.3	A result from extremal graph theory	223

1.3.4	The case of primes	225
1.3.5	Chains of primes in arithmetic progressions	226
	Bibliography	229
2	On the detailed structure of sets with small additive property,	
	<i>Gregory A. Freiman</i>	233
2.1	Small doubling	233
2.2	Sums of different sets	237
	Bibliography	239
3	The isoperimetric method,	
	<i>Yahya O. Hamidoune</i>	241
3.1	Universal bounds of set products	241
3.2	The Frobenius problem	243
3.3	The $\alpha + \beta$ -theorems	244
3.3.1	Direct theorems	244
3.3.2	Inverse theorems	245
3.4	Torsion-free groups: The isoperimetric approach	246
3.5	The isoperimetric formalism	248
3.6	The structure of k -atoms	250
	Bibliography	251
4	Additive structure of difference sets,	
	<i>Norbert Hegyvári</i>	253
4.1	Introduction	253
4.2	The case $D(A)$	255
4.3	An intermezzo; $D(D(A))$ is highly well structured	258
4.4	First difference sets and Bohr sets I	258
4.5	Raimi's theorem; difference set of partitions	261
4.6	First difference sets and Bohr sets II; Følner's theorem	263
4.7	Applications of Følner theorem	263
	Bibliography	265
5	The polynomial method in additive combinatorics,	
	<i>Gyula Károlyi</i>	267
5.1	Introduction	267
5.2	Applications of the polynomial method to additive problems	271
5.3	Appendix: The Vandermonde matrix	275
	Bibliography	277
6	Problems in additive number theory, III,	
	<i>Melvyn B. Nathanson</i>	279
6.1	What sets are sumsets?	279
6.2	Describing the structure of hA as $h \rightarrow \infty$	280

6.3	Representation functions	280
6.4	Sets with more sums than differences	282
6.5	Comparative theory of linear forms	284
6.6	The fundamental theorem of additive number theory	286
6.7	Thin asymptotic bases	287
6.8	Minimal asymptotic bases	288
6.9	Maximal asymptotic non-bases	289
6.10	Complementing sets of integers	290
6.11	The Caccetta–Häggkvist conjecture	293
	Bibliography	295
7	Incidences and the spectra of graphs,	
	<i>Jozsef Solymosi</i>	299
7.1	Introduction	299
7.2	The sum-product problem	300
	7.2.1 The sum-product graph	301
	7.2.2 The spectral bound	303
7.3	Three-term arithmetic progressions	304
	7.3.1 The 3-AP graph	304
7.4	Sidon functions	306
	7.4.1 Sidon functions	306
	7.4.2 A bipartite incidence graph	308
	7.4.3 The spectral bound	309
7.5	Incidence bounds on pseudolines	310
	7.5.1 The incidence bound	310
	7.5.2 Strongly regular graphs	311
	Bibliography	313
8	Multi-dimensional inverse additive problems,	
	<i>Yonutz V. Stanchescu</i>	315
8.1	Direct and inverse problems of additive and combinatorial number theory	315
8.2	The simplest inverse problem for sums of sets in several dimensions	316
8.3	Small doubling property on the plane	318
8.4	Planar sets with no three collinear points on a line	321
8.5	Exact structure results	323
8.6	Difference sets	324
8.7	Finite Abelian groups	325
	Bibliography	327
