The way of mathematical thought is twofold: the mathematician first proceeds inductively from the particular to the general and then deductively from the general to the particular. Moreover, throughout its development, mathematics has shown two aspects—the conceptual and the computational—the symphonic interleaving of which forms one of the major aspects of the subject’s aesthetic.

Let us therefore begin with the first mathematical structure—numbers. By the Hellenistic times, mathematicians distinguished between two types of numbers: the rational numbers, namely those which could be written in the form $\frac{m}{n}$ for some integer $m$ and some positive integer $n$, and those numbers representing the geometric magnitude of segments of the line, which today we call real numbers and which, in decimal notation, are written in the form $m.k_1k_2k_3\ldots$ where $m$ is an integer and the $k_i$ are digits. The fact that the set $\mathbb{Q}$ of rational numbers is not equal to the set $\mathbb{R}$ of real numbers was already noticed by the followers of the early Greek mathematician/mystic Pythagoras. On both sets of numbers we define operations of addition and multiplication which satisfy certain rules of manipulation. Isolating these rules as part of a formal system was a task first taken on in earnest by nineteenth-century British and German mathematicians. From their studies evolved the notion of a field, which will be basic to our considerations. However, since fields are not our primary object of study, we will delve only minimally into this fascinating notion. A serious consideration of field theory must be deferred to an advanced course in abstract algebra.

A nonempty set $F$ together with two functions $F \times F \rightarrow F$, respectively called addition (as usual, denoted by $+$) and multiplication (as usual, denoted by $\cdot$ or by concatenation), is a field if the following conditions are satisfied:

1. (associativity of addition and multiplication): $a + (b + c) = (a + b) + c$ and $a(bc) = (ab)c$ for all $a, b, c \in F$.
2. (commutativity of addition and multiplication): $a + b = b + a$ and $ab = ba$ for all $a, b \in F$.
3. (distributivity of multiplication over addition): $a(b + c) = ab + ac$ for all $a, b, c \in F$.
(4) **(existence of identity elements for addition and multiplication):** There exist distinct elements of \( F \), which we will denote by 0 and 1 respectively, satisfying \( a + 0 = a \) and \( a1 = a \) for all \( a \in F \).

(5) **(existence of additive inverses):** For each \( a \in F \) there exists an element of \( F \), which we will denote by \( -a \), satisfying \( a + (-a) = 0 \).

(6) **(existence of multiplicative inverses):** For each \( 0 \neq a \in F \) there exists an element of \( F \), which we will denote by \( a^{-1} \), satisfying \( a^{-1}a = 1 \).

With kind permission of the Archives of the Mathematisches Forschungsinstitut Oberwolfach (Weber, Dedekind, Kronecker and Steinitz).

The development of the abstract theory of fields is generally credited to the nineteenth-century German mathematician [Heinrich Weber](#), based on earlier work by the German mathematicians [Richard Dedekind](#) and [Leopold Kronecker](#). Another nineteenth-century mathematician, the British [Augustus De Morgan](#), was among the first—along with French mathematician [François Joseph Servois](#)—to isolate the importance of such properties as associativity, distributivity, and so forth. The final axioms of a field are due to the twentieth-century German mathematician [Ernst Steinitz](#).

Note that we did not assume that the elements \( -a \) and \( a^{-1} \) are unique, though we will soon prove that in fact they are. If \( a \) and \( b \) are elements of a field \( F \), we will follow the usual conventions by writing \( a - b \) instead of \( a + (-b) \) and \( \frac{a}{b} \) instead of \( ab^{-1} \). Moreover, if \( 0 \neq a \in F \) and if \( n \) is a positive integer, then \( na \) denotes the sum \( a + \cdots + a \) (\( n \) summands) and \( a^n \) denotes the product \( a \cdot \cdots \cdot a \) (\( n \) factors). If \( n \) is a negative integer, then \( na \) denotes \( (-n)(-a) \) and \( a^n \) denotes \( (a^{-1})^{-n} \). Finally, if \( n = 0 \) then \( na \) denotes the field element 0 and \( a^n \) denotes the field element 1. For \( 0 = a \in F \), we define \( na = 0 \) for all integers \( n \) and \( a^n = 0 \) for all positive integers \( n \).

The symbol \( 0^k \) is not defined for \( k \leq 0 \).

As an immediate consequence of the associativity and commutativity of addition, we see that the sum of any list \( a_1, \ldots, a_n \) of elements of a field \( F \) is the same, no matter in which order we add them. We can therefore unambiguously write \( a_1 + \cdots + a_n \). This sum is also often denoted by \( \sum_{i=1}^{n} a_i \). Similarly, the product of these elements is the same, no matter in which order we multiply them. We can therefore unambiguously write \( a_1 \cdots a_n \). This product is also often denoted by \( \prod_{i=1}^{n} a_i \). Also, a simple inductive argument shows that multiplication distributes over arbitrary sums: if \( a \in F \) and \( b_1, \ldots, b_n \) is a list of elements of \( F \) then \( a(\sum_{i=1}^{n} b_i) = \sum_{i=1}^{n} ab_i \).

We easily see that \( \mathbb{Q} \) and \( \mathbb{R} \), with the usual addition and multiplication, are fields.

A subset \( G \) of a field \( F \) is a **subfield** if and only if it contains 0 and 1, is closed under addition and multiplication, and contains the additive and multiplicative inverses of all of its nonzero elements. Thus, for example, \( \mathbb{Q} \) is a subfield of \( \mathbb{R} \). It is
easy to verify\(^1\) that the intersection of a collection of subfields of a field \(F\) is again a subfield of \(F\).

We now want to look at several additional important examples of fields.

**Example** Let \(C = \mathbb{R}^2\) and define operations of addition and multiplication on \(C\) by setting \((a, b) + (c, d) = (a + c, b + d)\) and \((a, b) \cdot (c, d) = (ac - bd, ad + bc)\). These operations define the structure of a field on \(C\), in which the identity element for addition is \((0, 0)\), the identity element for multiplication is \((1, 0)\), the additive inverse of \((a, b)\) is \((-a, -b)\), and

\[
(a, b)^{-1} = \left(\frac{a}{a^2 + b^2}, \frac{-b}{a^2 + b^2} \right)
\]

for all \((0, 0) \neq (a, b)\). This field is called the field of complex numbers. The set of all elements of \(C\) of the form \((a, 0)\) forms a subfield of \(C\), which we normally identify with \(\mathbb{R}\) and therefore it is standard to consider \(\mathbb{R}\) as a subfield of \(C\). In particular, we write \(a\) instead of \((a, 0)\) for any real number \(a\). The element \((0, 1)\) of \(C\) is denoted by \(i\). This element satisfies the condition that \(i^2 = (-1, 0)\) and so it is often written as \(\sqrt{-1}\). We also note that any element \((a, b)\) of \(C\) can be written as \((a, 0) + b(0, 1) = a + bi\), and, indeed, that is the way complex numbers are usually written and how we will denote them from now on. If \(z = a + bi\), then \(a\) is the real part of \(z\), which is often denoted by \(\text{Re}(z)\), while \(bi\) is the imaginary part of \(z\), which is often denoted by \(\text{Im}(z)\). The field of complex numbers is extremely important in mathematics. From a geometric point of view, if we identify \(\mathbb{R}\) with the set of points on the Euclidean line, as one does in analytic geometry, then it is natural to identify \(\mathbb{C}\) with the set of points in the Euclidean plane.
If \( z = a + bi \in \mathbb{C} \) then we denote the complex number \( a - bi \), called the complex conjugate of \( z \), by \( \overline{z} \). It is easy to see that for all \( z, z' \in \mathbb{C} \) we have \( \overline{z + z'} = \overline{z} + \overline{z}' \), \( \overline{z \cdot z'} = \overline{z} \cdot \overline{z}' \), \( \overline{z^{-1}} = (\overline{z})^{-1} \), and \( \overline{z} = z \). The number \( z \overline{z} \) equals \( a^2 + b^2 \), which is a nonnegative real number and so has a square root in \( \mathbb{R} \), which we will denote by \( |z| \). Note that \( |z| \) is nonzero whenever \( z \neq 0 \). From a geometric point of view, this number is just the distance from the number \( z \), considered as a point in the Euclidean plane, to the origin, just as the usual absolute value \( |a| \) of a real number \( a \) is the distance between \( a \) and 0 on the real line. It is easy to see that if \( y \) and \( z \) are complex numbers then \( |yz| = |y| \cdot |z| \) and \( |y + z| \leq |y| + |z| \). Moreover, if \( z = a + bi \) then

\[
z + \overline{z} = 2a \leq 2|a| = 2\sqrt{a^2} \leq 2\sqrt{a^2 + b^2} = 2|z|.
\]

We also note, as a direct consequence of the definition, that \( |z| = |\overline{z}| \) for every complex number \( z \) and so \( z^{-1} = |z|^{-2} \overline{z} \) for all \( 0 \neq z \in \mathbb{C} \). In particular, if \( |z| = 1 \) then \( z^{-1} = \overline{z} \).

**Example** The set \( \mathbb{Q}^2 \) is a subfield of the field \( \mathbb{C} \) defined above. However, it is also possible to define field structures on \( \mathbb{Q}^2 \) in other ways. Indeed, let \( F = \mathbb{Q}^2 \) and let \( p \) be a fixed prime integer. Define addition and multiplication on \( F \) by setting \( (a, b) + (c, d) = (a + c, b + d) \) and \( (a, b) \cdot (c, d) = (ac + bdp, ad + bc) \).

Again, one can check that \( F \) is indeed a field and that, again, the set of all elements of \( F \) of the form \((a, 0)\) is a subfield, which we will identify with \( \mathbb{Q} \). Moreover, the additive inverse of \((a, b) \in \mathbb{F} \) is \((-a, -b)\) and the multiplicative inverse of \((0, 0) \neq (a, b) \in \mathbb{F} \) is

\[
\left( \frac{a}{a^2 - pb^2}, \frac{-b}{a^2 - pb^2} \right).
\]

(We note that \( a^2 - pb^2 \) is the product of the nonzero real numbers \( a + b\sqrt{p} \) and \( a - b\sqrt{p} \) and so is nonzero.) The element \((0, 1)\) of \( F \) satisfies \((0, 1)^2 = (p, 0)\) and so one usually denotes it by \( \sqrt{p} \) and, as before, any element of \( F \) can be written in the form \( a + b\sqrt{p} \), where \( a, b \in \mathbb{Q} \). The field \( F \) is usually denoted by \( \mathbb{Q}(\sqrt{p}) \). Since there are infinitely-many distinct prime integers, we see that there are infinitely-many ways of defining different field structures on \( \mathbb{Q} \times \mathbb{Q} \), all having the same addition.

**Example** Fields do not have to be infinite. Let \( p \) be a positive integer and let \( \mathbb{Z}/(p) = \{0, 1, \ldots, p - 1\} \). For each nonnegative integer \( n \), let us, for the purposes of this example, denote the remainder after dividing \( n \) by \( p \) as \([n]_p\). Thus we note that \([n]_p \in \mathbb{Z}/(p) \) for each nonnegative integer \( n \) and that \([i]_p = i \) for all \( i \in \mathbb{Z}/(p) \). We now define operations on \( \mathbb{Z}/(p) \) by setting \([n]_p + [k]_p = [n + k]_p \) and \([n]_p \cdot [k]_p = [nk]_p \). It is easy to check that if the integer \( p \) is prime then \( \mathbb{Z}/(p) \), together with these two operations, is again a field, known as the Galois field of order \( p \). This field is usually denoted by \( \text{GF}(p) \). While Galois fields were first considered mathematical curiosities, they have since found important applications in coding theory, cryptography, and modeling of computer processes.
These are not the only possible finite fields. Indeed, it is possible to show that for each prime integer \( p \) and each positive integer \( n \) there exists an (essentially unique) field with \( p^n \) elements, usually denoted by \( \text{GF}(p^n) \).

With kind permission of Bibliothèque nationale de France (Galois); With kind permission of the American Mathematical Society (Moore).

The nineteenth-century French mathematical genius **Evariste Galois**, who died at the age of 21, was the first to consider such structures. The study of finite and infinite fields was unified in the 1890s by **Eliakim Hastings Moore**, the first American-born mathematician to achieve an international reputation.

**Example** Some important structures are “very nearly” fields. For example, let \( \mathbb{R}_\infty = \mathbb{R} \cup \{ \infty \} \), and define operations \( \boxplus \) and \( \boxtimes \) on \( \mathbb{R}_\infty \) by setting

\[
a \boxplus b = \begin{cases} 
\min\{a, b\} & \text{if } a, b \in \mathbb{R}, \\
b & \text{if } a = \infty, \\
a & \text{if } b = \infty,
\end{cases}
\]

and

\[
a \boxtimes b = \begin{cases} 
a + b & \text{if } a, b \in \mathbb{R}, \\
\infty & \text{otherwise}.
\end{cases}
\]

This structure, called the *optimization algebra*, satisfies all of the conditions of a field *except* for the existence of additive inverses (such structures are known as *semi-fields*). As the name suggests, it has important applications in optimization theory and the analysis of discrete-event dynamical systems. There are several other semi-fields which have significant applications and which have been extensively studied.

Another possibility of generalizing the notion of a field is to consider an algebraic structure which satisfies all of the conditions of a field *except* for the existence of multiplicative inverses, and to replace that condition by the condition that if \( a, b \neq 0 \) then \( ab \neq 0 \). Such structures are known as *integral domains*. The set \( \mathbb{Z} \) of all integers is the simplest example of an integral domain which is not a field. Algebras of polynomials over a field, which we will consider later, are also integral domains. In a course in abstract algebra, one proves that any integral domain can be embedded in a field.

In the field \( \text{GF}(p) \) which we defined above, one can easily see that the sum \( 1 + \cdots + 1 \) (\( p \) summands) equals 0. On the other hand, in the field \( \mathbb{Q} \), the sum of any number of copies of 1 is always nonzero. This is an important distinction which we will need to take into account in dealing with structures over fields. We therefore define the *characteristic* of a field \( F \) to be equal to the smallest positive integer \( p \) such that \( 1 + \cdots + 1 \) (\( p \) summands) equals 0—-if such an integer \( p \) exists—and to be
equal to 0 otherwise. We will not delve deeply into this concept, which is dealt with in courses on field theory, except to note that the characteristic of a field, if nonzero, always turns out to be a prime number, as we shall prove below.

In the definition of a field, we posited the existence of distinct identity elements for addition and multiplication, but did not claim that these elements were unique. It is, however, very easy to prove that fact.

**Proposition 2.1** Let $F$ be a field.

1. If $e$ is an element of $F$ satisfying $e + a = a$ for all $a \in F$ then $e = 0$;
2. If $u$ is an element of $F$ satisfying $ua = a$ for all $a \in F$ then $u = 1$.

**Proof** By definition, $e = e + 0 = 0$ and $u = u1 = 1$. □

Similarly, we prove that additive and multiplicative inverses, when they exist, are unique. Indeed, we can prove a stronger result.

**Proposition 2.2** If $a$ and $b$ are elements of a field $F$ then:

1. There exists a unique element $c$ of $F$ satisfying $a + c = b$.
2. If $a \neq 0$ then there exists a unique element $d$ of $F$ satisfying $ad = b$.

**Proof** (1) Choose $c = b - a$. Then

$$a + c = a + (b - a) = a + [b + (-a)]$$

$$= a + [(-a) + b] = [a + (-a)] + b = 0 + b = b.$$  

Moreover, if $a + x = b$ then

$$x = 0 + x = [(-a) + a] + x$$

$$= (-a) + (a + x) = (-a) + b = b - a,$$

proving uniqueness.

(2) Choose $d = a^{-1}b$. Then $ad = a(a^{-1}b) = (aa^{-1})b = 1b = b$. Moreover, if $ay = b$ then $y = 1y = (a^{-1}a)y = a^{-1}(ay) = a^{-1}b$, proving uniqueness. □

We now summarize some of the elementary properties of fields, which are all we will need for our discussion.
**Proposition 2.3** If \( a, b, \) and \( c \) are elements of a field \( F \) then:

1. \( 0a = 0; \)
2. \( -(1)a = -a; \)
3. \( a(-b) = -(ab) = (-a)b; \)
4. \( -(a) = a; \)
5. \( -(a)(-b) = ab; \)
6. \( -(a + b) = -(a) + -(b); \)
7. \( ab = c = ab - ac; \)
8. \( a \neq 0 \) then \( (a^{-1})^{-1} = a; \)
9. \( a, b \neq 0 \) then \( (ab)^{-1} = b^{-1}a^{-1}; \)
10. \( a + c = b + c \) then \( a = b; \)
11. \( c \neq 0 \) and \( ac = bc \) then \( a = b; \)
12. \( ab = 0 \) then \( a = b \) or \( b = 0. \)

**Proof**

(1) Since \( 0a + 0a = (0 + 0)a = 0a, \) we can add \( -0a \) to both sides of the equation to obtain \( 0a = 0. \)

(2) Since \( -(1)a + a = (-1)a + 1a = \left((-1) + 1\right)a = 0a = 0 \) and also \( -(a) + a = 0, \) we see from Proposition 2.2 that \( -(1)a = -a. \)

(3) By (2) we have \( a(-b) = a\left((-1)b\right) = (-1)ab = -(ab) \) and similarly \( -(a)b = -(ab). \)

(4) Since \( a + (-a) = 0 = -(a) + (-a), \) this follows from Proposition 2.2.

(5) From (3) and (4) it follows that \( -(a)(-b) = a\left([-(-b)]\right) = ab. \)

(6) Since \( (a + b) + ((-a) + (-b)) = a + b + (-a) + (-b) = 0, \) and \( (a + b) + [-(a + b)] = 0, \) the result follows from Proposition 2.2.

(7) By (3) we have \( a(b - c) = ab + a(-c) = ab + [-(ac)] = ab - ac. \)

(8) Since \( (a^{-1})^{-1}a^{-1} = 1 = aa^{-1}, \) this follows from Proposition 2.2.

(9) Since \( (a^{-1}b^{-1})(ba) = a^{-1}ab^{-1}b = 1 = (ab)^{-1}(ba), \) the result follows from Proposition 2.2.

(10) This is an immediate consequence of adding \( -c \) to both sides of the equation.

(11) This is an immediate consequence of multiplying both sides of the equation by \( c^{-1}. \)

(12) If \( b = 0 \) we are done. If \( b \neq 0 \) then by (1) it follows that multiplying both sides of the equation by \( b^{-1} \) will yield \( a = 0. \)

The following two propositions are immediate consequences of Proposition 2.3.

**Proposition 2.4** Let \( a \) be a nonzero element of a finite field \( F \) having \( q \) elements. Then \( a^{-1} = a^{q-2}. \)

**Proof**

If \( q = 2 \) then \( F = GF(2) \) and \( a = 1, \) so the result is immediate. Hence we can assume \( q > 2. \) Let \( B = \{a_1, \ldots, a_{q-1}\} \) be the nonzero elements of \( F, \) written in some arbitrary order. Then \( aa_i \neq aa_h \) for \( i \neq h \) since, were they equal,
we would have \( a_i = a^{-1}(aa_i) = a^{-1}(aa_h) = a_h \). Therefore \( B = \{ aa_1, \ldots, aa_{q-1} \} \) and so \( \prod_{i=1}^{q-1} a_i = \prod_{i=1}^{q-1} (aa_i) = a^{q-1} \left[ \prod_{i=1}^{q-1} a_i \right] \). Moreover, this is a product of nonzero elements of \( F \) and so, by Proposition 2.3(12), is also nonzero. Therefore, by Proposition 2.3(11), \( 1 = a^{q-1} \), and so \( aa^{-1} = 1 = a^{q-1} = a(a^{q-2}) \), implying that \( a^{-1} = a^{q-2} \).

**Proposition 2.5** If \( F \) is a field having characteristic \( p > 0 \), then \( p \) is prime.

**Proof** Assume that \( p \) is not prime. Then \( p = hk \), where \( 0 < h, k < p \). Therefore, \( a = h1_F \) and \( b = k1_F \) are nonzero elements of \( F \). But \( ab = (hk)1_F = p1_F = 0 \), contradicting Proposition 2.3(12).

Of course, one can use Proposition 2.3 to prove many other identities among elements of a field. A typical example is the following

**Proposition 2.6 (Hua’s identity)** If \( a \) and \( b \) are nonzero elements of a field \( F \) satisfying \( a \neq b^{-1} \) then

\[
a - aba = (a^{-1} + [b^{-1} - a]^{-1})^{-1}.
\]

**Proof** We note that

\[
a^{-1} + (b^{-1} - a)^{-1} = a^{-1}[(b^{-1} - a) + a](b^{-1} - a)^{-1}
\]

\[
= a^{-1}b^{-1}(b^{-1} - a)^{-1},
\]

so \((a^{-1} + [b^{-1} - a]^{-1})^{-1} = (b^{-1} - a)ba = a - aba \).  

**Loo-Keng Hua** was a major twentieth-century Chinese mathematician.
Exercise 1
Let $F$ be a field and let $G = F \times F$. Define operations of addition and multiplication on $G$ by setting $(a, b) + (c, d) = (a + c, b + d)$ and $(a, b) \cdot (c, d) = (ac, bd)$. Do these operations define the structure of a field on $G$?

Exercise 2
Let $K$ be the set of the following four-tuples of elements of $GF(3)$:

$(0, 0, 0, 0), (1, 2, 1, 1), (2, 1, 2, 2), (1, 0, 0, 1), (2, 2, 1, 2), (2, 0, 0, 2), (0, 1, 2, 0), (0, 2, 1, 0), (1, 1, 2, 1)$.

Define operations of addition and multiplication on $K$ so that it becomes a field.

Exercise 3
Let $r \in \mathbb{R}$ and let $0 \neq s \in \mathbb{R}$. Define operations $\boxplus$ and $\boxdot$ on $\mathbb{R} \times \mathbb{R}$ by $(a, b) \boxplus (c, d) = (a + c, b + d)$ and $(a, b) \boxdot (c, d) = (ac - bd(r^2 + s^2), ad + bc + 2rbd)$. Do these operations, considered as addition and multiplication, respectively, define the structure of a field on $\mathbb{R} \times \mathbb{R}$?

Exercise 4
Define a new operation $\dagger$ on $\mathbb{R}$ by setting $a \dagger b = a^3b$. Show that $\mathbb{R}$, on which we have the usual addition and this new operation as multiplication, satisfies all of the axioms of a field with the exception of one.

Exercise 5
Let $1 < t \in \mathbb{R}$ and let $F = \{a \in \mathbb{R} \mid a < 1\}$. Define operations $\oplus$ and $\odot$ on $F$ as follows:

1. $a \oplus b = a + b - ab$ for all $a, b \in F$;
2. $a \odot b = 1 - f^{\log_2(1-a)\log_2(1-b)}$ for all $a, b \in F$.

For which values of $t$ does $F$, together with these operations, form a field?

Exercise 6
Show that the set of all real numbers of the form $a + b\sqrt{2} + c\sqrt{3} + d\sqrt{6}$, where $a, b, c, d \in \mathbb{Q}$, forms a subfield of $\mathbb{R}$.

Exercise 7
Is $\{a + b\sqrt{15} \mid a, b \in \mathbb{Q}\}$ a subfield of $\mathbb{R}$?

Exercise 8
Show that the field $\mathbb{R}$ has infinitely-many distinct subfields.

Exercise 9
Let $F$ be a field and define a new operation $\ast$ on $F$ by setting $a \ast b = a + b + ab$. When is $(F, +, \ast)$ a field?
Exercise 10
Let $F$ be a field and let $G_n$ be the subset of $F$ consisting of all elements which can be written as a sum of $n$ squares of elements of $F$.
(1) Is the product of two elements of $G_2$ again an element of $G_2$?
(2) Is the product of two elements of $G_4$ again an element of $G_4$?

Exercise 11
Let $t = \sqrt{2} \in \mathbb{R}$ and let $S$ be the set of all real numbers of the form $a + bt + ct^2$, where $a, b, c \in \mathbb{Q}$. Is $S$ a subfield of $\mathbb{R}$?

Exercise 12
Let $F$ be a field. Show that the function $a \mapsto a - 1$ is a permutation of $F \setminus \{0_F\}$.

Exercise 13
Show that every $z \in \mathbb{C}$ satisfies
\[ z^4 + 4 = (z - 1 - i)(z - i + i)(z + 1 + i)(z + 1 - i). \]

Exercise 14
In each of the following, find the set of all complex numbers $z = a + bi$ satisfying the given relation. Note that this set may be empty or may be all of $\mathbb{C}$. Justify your result in each case.
(a) $z^2 = \frac{1}{2}(1 + i \sqrt{3})$;
(b) $(\sqrt{2})|z| \geq |a| + |b|$;
(c) $|z| + z = 2 + i$;
(d) $z^4 = 2 - (\sqrt{12})i$;
(e) $z^4 = -4$.

Exercise 15
Let $y$ be a complex number satisfying $|y| < 1$. Find the set of all complex numbers $z$ satisfying $|z - y| \leq |1 - \overline{y}z|$.

Exercise 16
Let $z_1, z_2, z_3$ be complex numbers satisfying the condition that $|z_i| = 1$ for $i = 1, 2, 3$. Show that $|z_1z_2 + z_1z_3 + z_2z_3| = |z_1 + z_2 + z_3|$.

Exercise 17
For any $z_1, z_2 \in \mathbb{C}$, show that $|z_1|^2 + |z_2|^2 - z_1 \overline{z_2} - z_2 \overline{z_1} = |z_1 - z_2|^2$.

Exercise 18
Show that $|z + 1| \leq |z + 1|^2 + |z|$ for all $z \in \mathbb{C}$.

Exercise 19
If $z \in \mathbb{C}$, find $w \in \mathbb{C}$ satisfying $w^2 = z$. 
Exercise 20
Define new operations $\circ$ and $\diamond$ on $\mathbb{C}$ by setting $y \circ z = |y|z$ and

$$y \diamond z = \begin{cases} 
0 & \text{if } y = 0, \\
\frac{1}{|y|}yz & \text{otherwise}
\end{cases}$$

for all $y, z \in \mathbb{C}$. Is it true that $w \diamond (y \circ z) = (w \circ y) \diamond (w \circ z)$ and $w \circ (y \circ z) = (w \circ y) \circ (w \circ z)$ for all $w, y, z \in \mathbb{C}$?

Exercise 21
Let $0 \neq z \in \mathbb{C}$. Show that there are infinitely-many complex numbers $y$ satisfying the condition $y\overline{y} = z\overline{z}$.

Exercise 22
(ABEL’S INEQUALITY) Let $z_1, \ldots, z_n$ be a list of complex numbers and, for each $1 \leq k \leq n$, let $s_k = \sum_{i=1}^{k} z_i$. For real numbers $a_1, \ldots, a_n$ satisfying $a_1 \geq a_2 \geq \cdots \geq a_n \geq 0$, show that $|\sum_{i=1}^{n} a_i z_i| \leq a_1 (\max_{1 \leq k \leq n} |s_k|)$.

Exercise 23
Let $0 \neq z_0 \in \mathbb{C}$ satisfy the condition $|z_0| < 2$. Show that there are precisely two complex numbers, $z_1$ and $z_2$, satisfying $|z_1| + |z_2| = 1$ and $z_1 + z_2 = z_0$.

Exercise 24
If $p$ is a prime positive integer, find all subfields of $\mathrm{GF}(p)$.

Exercise 25
Find $10^{-1}$ in $\mathrm{GF}(33)$.

Exercise 26
Find elements $c, d \neq \pm 1$ in the field $\mathbb{Q}(\sqrt{5})$ satisfying $cd = 19$. 

With kind permission of the Archives of the Mathematisches Forschungsinstitut Oberwolfach.

The nineteenth-century Norwegian mathematical genius Niels Henrik Abel died tragically at the age of 26.
Exercise 27
Let $F$ be the set of all real numbers of the form

$$a + b(\sqrt[3]{5}) + c(\sqrt[3]{5})^2,$$

where $a, b, c \in \mathbb{Q}$. Is $F$ a subfield of $\mathbb{R}$?

Exercise 28
Let $p$ be a prime positive integer and let $a \in \text{GF}(p)$. Does there necessarily exist an element $b$ of $\text{GF}(p)$ satisfying $b^2 = a$?

Exercise 29
Let $F = \text{GF}(11)$ and let $G = F \times F$. Define operations of addition and multiplication on $G$ by setting $(a, b) + (c, d) = (a + c, b + d)$ and $(a, b) \cdot (c, d) = (ac + 7bd, ad + bc)$. Do these operations define the structure of a field on $G$?

Exercise 30
Let $F$ be a field and let $G$ be a finite subset of $F \setminus \{0\}$ containing 1 and satisfying the condition that if $a, b \in F$ then $ab^{-1} \in G$. Show that there exists an element $c \in G$ such that $G = \{ci \mid i \geq 0\}$.

Exercise 31
Let $F$ be a field satisfying the condition that the function $a \mapsto a^2$ is a permutation of $F$. What is the characteristic of $F$?

Exercise 32
Is $\mathbb{Z}/(6)$ an integral domain?

Exercise 33
Let $F = \{a + b\sqrt{5} \in \mathbb{Q}(\sqrt{5}) \mid a, b \in \mathbb{Z}\}$. Is $F$ an integral domain?

Exercise 34
Let $F$ be an integral domain and let $a \in F$ satisfy $a^2 = a$. Show that $a = 0$ or $a = 1$.

Exercise 35
Let $a$ be a nonzero element in an integral domain $F$. If $b \neq c$ are distinct elements of $F$, show that $ab \neq ac$.

Exercise 36
Let $F$ be an integral domain and let $G$ be a nonempty subset of $F$ containing 0 and 1 and closed under the operations of addition and multiplication in $F$. Is $G$ necessarily an integral domain?

Exercise 37
Let $U$ be the set of all positive integers and let $F$ be the set of all functions from $U$ to $\mathbb{C}$. Define operations of addition and multiplication on $F$ by setting
Exercise 38
Let $F$ be the set of all functions $f$ from $\mathbb{R}$ to itself of the form $f : t \mapsto \sum_{k=1}^{n} [a_k \cos(kt) + b_k \sin(kt)]$, where the $a_k$ and $b_k$ are real numbers and $n$ is some positive integer. Define addition and multiplication on $F$ by setting $f + g : t \mapsto f(t) + g(t)$ and $fg : t \mapsto f(t)g(t)$ for all $t \in \mathbb{R}$. Is $F$, together with these operations, an integral domain? Is it a field?

Exercise 39
Show that every integral domain having only finitely-many elements is a field.

Exercise 40
Let $F$ be a field of characteristic other than 2 in which there exist elements $a_1, \ldots, a_n$ satisfying $\sum_{i=1}^{n} a_i^2 = -1$. (This happens, for example, in the case $F = \mathbb{C}$.) Show that for any $c \in F$ there exist elements $b_1, \ldots, b_k$ of $F$ satisfying $c = \sum_{i=1}^{k} b_i^2$.

Exercise 41
Let $p$ be a prime integer. Show that for each $a \in \text{GF}(p)$ there exist elements $b$ and $c$ of $\text{GF}(p)$, not necessarily distinct, satisfying $a = b^2 + c^2$.

Exercise 42
Let $F$ be a field in which we have elements $a$, $b$, and $c$ (not necessarily distinct) satisfying $a^2 + b^2 + c^2 = -1$. Show that there exist (not necessarily distinct) elements $d$ and $e$ of $F$, satisfying $d^2 + e^2 = -1$.

Exercise 43
Is every nonzero element of the field GF(5) in the form $2^i$ for some positive integer $i$? What happens in the case of the field GF(7)?

Exercise 44
Find the set of all fields $F$ in which there exists an element $a$ satisfying the condition that $a + b = a$ for all $b \in F \setminus \{a\}$.

Exercise 45
(Binomial formula) If $a$ and $b$ are elements of a field $F$, and if $n$ is a positive integer, show that $(a + b)^n = \sum_{k=0}^{n} \binom{n}{k} a^k b^{n-k}$.

Exercise 46
Let $F$ be a field of characteristic $p > 0$. Show that the function $\gamma : F \rightarrow F$ defined by $\gamma : a \mapsto a^p$ is monic.
Exercise 47
Let \( a \) and \( b \) be nonzero elements of a finite field \( F \), and let \( m \) and \( n \) be positive integers satisfying \( a^m = b^n = 1 \). Show that there exists a nonzero element \( c \) of \( F \) satisfying \( c^k = 1 \), where \( k \) is the least common multiple of \( m \) and \( n \).

Exercise 48
If \( a \) is a nonzero element of a field \( F \), show that \( (-a)^{-1} = -(a^{-1}) \).

Exercise 49
Let \( F = \text{GF}(7) \) and let \( K = F \times F \). Define addition and multiplication on \( K \) by setting \( (a, b) + (c, d) = (a + b, c + d) \) and \( (a, b) \cdot (c, d) = (ac - bd, ad + bc) \). Do these operations turn \( K \) into a field? What happens if \( F = \text{GF}(5) \)?

Exercise 50
A field \( F \) is orderable if and only if there exists a subset \( P \) closed under addition and multiplication such that for each \( a \in F \) precisely one of the following conditions holds: (i) \( a = 0 \); (ii) \( a \in P \); (iii) \( -a \in P \). Show that \( \text{GF}(5) \) is not orderable.

Exercise 51
Let \( F \) be a field and let \( K \) be the set of all functions \( f \in F^\mathbb{Z} \) satisfying the condition that there exists an integer (perhaps negative) \( n_f \) such that \( f(i) = 0 \) for all \( i < n_f \). Define operations of addition and multiplication on \( K \) by setting \( f + g : i \mapsto f(i) + g(i) \) and \( fg : i \mapsto \sum_{j+h=i} f(j)g(h) \). Show that \( K \) is a field, called the field of formal Laurent series over \( F \).\(^2\)

Exercise 52
Let \( F \) be a field. Find \( A = \{(x, y) \in F^2 \mid x^2 + y^2 = 1\} \).

Exercise 53
Let \( F \) be a field having characteristic \( p > 0 \) and let \( c \in F \). Show that there is at most one element \( b \) of \( F \) satisfying \( b^p = c \).

Exercise 54
A ternary ring is a set \( R \) containing distinguished elements 0 and 1, together with a function \( \theta : R^3 \to R \) satisfying the following conditions:
\begin{enumerate}
  \item \( \theta(1, a, 0) = \theta(a, 1, 0) = a \) for all \( a \in R \);
  \item \( \theta(a, 0, c) = \theta(0, a, c) = c \) for all \( c \in R \);
  \item If \( a, b, c \in R \) then there is a unique element \( y \) of \( R \) satisfying \( \theta(a, b, y) = c \);
  \item If \( a, a', b, b' \in R \) with \( a \neq a' \) then there is a unique element \( x \) of \( R \) satisfying \( \theta(x, a, b) = \theta(x, a', b') \);
  \item If \( a, a', b, b' \in R \) with \( a \neq a' \) then there are unique elements \( x \) and \( y \) of \( R \) satisfying \( \theta(a, x, y) = b \) and \( \theta(a', x, y) = b' \).
\end{enumerate}

\(^2\)These series were first studied by the nineteenth-century French engineer and mathematician, Pierre Alphonse Laurent.
Such structures have applications in projective geometry. If $F$ is a field, show that we can define a function $\theta : F^3 \to F$ in such a way that $F$ becomes a tertiary ring (with 0 and 1 being the neutral elements of the field).

**Exercise 55**

For $h = 1, 2, 3$, let $z_h = a_h + b_hi$ be a complex number satisfying $|z_h| = 1$. Assume, moreover, that $\sum_{i=1}^{3} z_i = 0$. Show that the points $(a_h, b_h)$ are the vertices of an equilateral triangle in the Euclidean plane.
