

Contents

1	Introduction	1
1.1	Models of Mechanisms	2
1.2	Heuristics and Strategies in Photosynthesis Research	6
1.3	The Individual and the Community	8
1.4	Survey of the Book	12
2	In Pursuit of a Pathway (1843–1918)	15
2.1	The Nineteenth-Century Conception of Photosynthesis	16
2.2	Finding the Chemical Mechanism	18
2.2.1	Justus Liebig and the Organic Acid Model	19
2.2.2	Adolf von Baeyer and the Formaldehyde Model	22
2.2.3	Testing and Modification	25
2.2.4	The Formaldehyde Problem	28
2.3	Reconciling the First Approaches	30
2.3.1	The Formic Acid Model	31
2.3.2	The Organic Acid–Formaldehyde Hypothesis	32
2.3.3	The Water Cleavage Model	32
2.3.4	The Chlorophyll Complex Model	34
2.4	Features Common to the Models	36
2.4.1	Simplicity and Simplification	36
2.4.2	Incomplete Empirical Support	39
2.4.3	Selected Focus and Modules	40
2.5	Model-Building Heuristics	41
2.5.1	Extending a Prototype	41
2.5.2	The Transfer of Causal Knowledge	42
2.5.3	The Building Block Strategy	44
2.5.4	The Principle of Plurality	46
2.6	Collective Versus Individual Goals	48
2.6.1	Photosynthesis as a Side Issue	48
2.6.2	Constructive Research Opportunism	51

3	Otto Warburg and the Turn to Manometry (1912–1925)	55
3.1	New Materials and Methods	56
3.1.1	Otto Warburg (1883–1970)	56
3.1.2	Manometry	58
3.1.3	Chlorella	60
3.1.4	Buffer Solution	63
3.1.5	Bolometry	63
3.1.6	Rotating Sectors: The Flashing Light Technique	64
3.1.7	Inhibitors	64
3.2	Warburg’s Early Photosynthesis Model	65
3.2.1	Experimental Findings and the Interpretations thereof	66
3.2.2	Photosynthesis Framed as Photolysis	73
3.3	The Efficiency of the Process	75
3.4	Father, Son and Photosynthesis	78
3.4.1	Emil Warburg and Photochemistry	78
3.4.2	Influences on Otto Warburg	80
3.5	Studies in Cell Respiration	83
3.6	Comparison with the Chlorophyll-Complex Model	87
3.7	Otto Warburg’s Building Blocks	89
3.8	Warburg’s Impact on Photosynthesis Research	90
4	Struggling with the Standard Model (1930–1941)	93
4.1	Fluorescence and the Standard Model	94
4.1.1	The Kautsky Effect	94
4.1.2	James Franck and Photosynthesis	96
4.1.3	The New Standard Model	99
4.2	The Crucial Experiments of 1932	108
4.2.1	Robert Emerson: Harvard, Berlin, Caltech and Stanford	108
4.2.2	Emerson, Arnold and 2500 Molecules of Chlorophyll	110
4.3	The Generalised Equation for Photosynthesis	113
4.3.1	Cornelis B. Van Niel and General Microbiology	113
4.3.2	Bacterial Photosynthesis and the Consequences	116
4.4	The Photosynthetic Unit	120
4.4.1	Context and Scope of the 1936 Paper	122
4.4.2	Critique of the Standard Model	124
4.4.3	The Unit as Explanatory Alternative	125
4.5	Franck’s Conservative Alternatives	126
4.5.1	Franck and Herzfeld’s Proposal	126
4.5.2	Franck’s Further Attempts	129
4.6	Isolated Chloroplasts and Water Splitting	132
4.6.1	Robert (Robin) Hill and the Chloroplast Reaction	132
4.6.2	Implications of the Findings	137
4.7	On the Verge of New Perspectives	138
4.7.1	Biological Studies Generalised	138
4.7.2	The Main Lines of Thought	140
4.7.3	A New Conception of Photosynthesis	146

5	The Maximum Quantum Yield Controversy (1937–1955)	149
5.1	Photochemical Quantum Yield Measurements	150
5.2	First Opponents of the Warburg–Negelein Value	151
5.3	Emerson and Lewis’s Challenge	153
5.3.1	The Carbon Dioxide Burst (1939–1941)	153
5.3.2	The Red Drop (1943)	156
5.4	Wartime	157
5.5	Attempts to Find a Solution	161
5.5.1	The Photosynthesis Project at Urbana	161
5.5.2	Warburg Comes to the United States	161
5.5.3	The Time Spent at Urbana	164
5.5.4	The Rediscovery of the Maximum Quantum Yield	167
5.5.5	Franck’s Attempt to Find a Compromise	171
5.5.6	Further Exchanges of Blows	172
5.5.7	Controversial Themes Around 1950	174
5.6	A Hardening of the Fronts	178
5.6.1	The One-Quantum Mechanism	178
5.6.2	The Gatlinburg Conference on Photosynthesis, 1952	181
5.6.3	Emerson Strikes Back (1955)	187
5.7	The Aftermath	190
5.7.1	The Enhancement Effect	190
5.7.2	Emerson’s Death and Beyond	193
5.8	How Controversies End	194
6	The Path of Carbon in Photosynthesis (1937–1954)	201
6.1	Early Radiotracer Experiments	202
6.1.1	Kamen Meets the Cyclotron	202
6.1.2	Kamen Meets Ruben	204
6.1.3	The First Metabolism Experiments	207
6.1.4	Carbon-14 and the End of a Collaboration	212
6.2	The Bio-Organic Chemistry Group	214
6.3	The First Cyclic Model	220
6.4	New Methods and a New Model	226
6.4.1	Paper Chromatography	226
6.5	The Second Cyclic Model (1950)	229
6.6	In Need of Re-Orientation	232
6.6.1	Two Unexpected Compounds (1952)	232
6.6.2	The Degradation Studies	234
6.7	The Saturation Experiments	236
6.8	The Path XXI Paper	240
6.8.1	The Fraction 1 Protein	243
6.9	The Heuristics of the Berkeley Group	246

7	Elucidating the Light Reactions (1950–1961)	251
7.1	The Synthesis of Reducing Power	253
7.2	Photophosphorylation	257
7.2.1	Energy-Rich Phosphate Bonds and Photosynthesis	257
7.2.2	The “Compartment Model” Challenged	262
7.3	Cytochromes and Ferredoxin	268
7.3.1	Background	268
7.3.2	Photosynthetic Cytochromes	270
7.3.3	Ferredoxin	273
7.4	Photosynthetic Electron Transport Chains	277
7.4.1	Arnon’s First Model	277
7.5	Energy Migration, Chlorophyll <i>a</i> and P700	282
7.5.1	Early Observations	282
7.5.2	Fluorescence Resonance Transfer	285
7.5.3	Special Pigments and the Antagonistic Light Effect	290
7.6	A Solution That Was in the Air	292
7.6.1	Far-Sighted Ideas at Urbana	293
7.6.2	The Thermodynamic Approach	296
7.6.3	Spectroscopy and Two Photosystems	299
7.6.4	Two Light Reactions, One Pigment	302
7.6.5	New Flashing Light Experiments	303
7.6.6	The Z-Scheme	305
7.7	Convergent Research Pathways	307
	Epilogue	311
	References	317
	Index	347

Explaining Photosynthesis

Models of Biochemical Mechanisms, 1840-1960

Nickelsen, K.

2015, X, 349 p. 62 illus., 6 illus. in color., Hardcover

ISBN: 978-94-017-9581-4
