# Contents

Semiclassical Correlation Functions ........................................... 1
1 Coherent States ................................................................. 5
2 Husimi Distribution .......................................................... 7
3 Semiclassical Limit Using Wigner Functions ............................. 11
4 Gabor Transform .............................................................. 14
5 Semiclassical Limit of Joint Distribution Function ..................... 15
6 Semiclassical Limit Using Coherent States ............................... 17
7 Convergence of Quantum Solutions to Classical Solutions .......... 20
References .............................................................................. 25

Lecture 2: Pseudo-differential Operators. Berezin, Kohn–Nirenberg,
Born–Jordan Quantizations .......................................................... 27
1 Weyl Symbols ........................................................................ 28
2 Pseudo-differential Operators .................................................. 29
3 Calderon–Vaillantcourt Theorem ............................................. 32
4 Classes of Pseudo-differential Operators. Regularity Properties .... 36
5 Product of Operator Versus Products of Symbols ....................... 39
6 Correspondence Between Commutators and Poisson Brackets; Time Evolution ....................................................... 41
7 Berezin Quantization .............................................................. 44
8 Toeplitz Operators ................................................................. 46
9 Kohn–Nirenberg Quantization ................................................ 47
10 Shubin Quantization .............................................................. 48
11 Born–Jordarn Quantization ...................................................... 49
References .............................................................................. 50

Lecture 3: Compact and Schatten Class Operators. Compactness
Criteria. Bouquet of Inequalities .................................................. 51
1 Schatten Classes ...................................................................... 55
2 General Traces ....................................................................... 57
3 General $L^p$ Spaces ............................................................... 58
Lecture 4: Periodic Potentials, Wigner–Seitz Cell and Brillouin Zone. Bloch and Wannier Functions

1 Fermi Surface, Fermi Energy ..................................................... 84
   The Theory of Bloch-Floquet-Zak ........................................ 87
3 Decompositions ................................................................. 88
4 One Particle in a Periodic Potential ....................................... 91
5 The Mathieu Equation ............................................................ 95
6 The Case $d \geq 2$. Fibration in Momentum Space ..................... 96
7 Direct Integral Decomposition ................................................ 98
8 Wannier Functions ............................................................... 103
9 Chern Class ........................................................................... 106
References .............................................................................. 108

Lecture 5: Connection with the Properties of a Crystal.
Born–Oppenheimer Approximation. Edge States and Role of Topology .................................................. 111
1 Crystal in a Magnetic Field ..................................................... 113
2 Slowly Varying Electric Field .................................................. 114
3 Heisenberg Representation ..................................................... 118
4 Pseudo-differential Point of View ............................................ 119
5 Topology Induced by a Magnetic Field .................................... 121
6 Algebraic-Geometric Formulation .......................................... 123
7 Determination of a Topological Index ...................................... 125
8 Gauge Transformation, Relative Index and Quantum Pumps ..... 129
References .............................................................................. 131

Lecture 6: Lie–Trotter Formula, Wiener Process, Feynman–Kac Formula ................................................. 133
1 The Feynman Formula ............................................................ 138
2 Stationary Action; The Fujiwara’s Approach ............................. 140
3 Generalizations of Fresnel Integral ........................................... 141
4 Relation with Stochastic Processes .......................................... 142
5 Random Variables. Independence ........................................... 144
6 Stochastic Processes, Markov Processes .................................. 145
7 Construction of Markov Processes ......................................... 146
