Environmental Fluid Mechanics

Editor-in-Chief: H.J. Fernando

- Provides reviews and original articles addressing the atmosphere, and laboratory simulations of natural flows
- Offers a medium for the publication of interdisciplinary studies on the interactions between natural fluid systems and their boundaries
- Presents articles reporting observational, experimental, modeling and theoretical investigations

Please note, we are currently updating the 2018 Journal Metrics.

Environmental Fluid Mechanics is devoted to the publication of basic and applied studies broadly relating to natural fluid systems, particularly as agents for the transport and dispersion of environmental contamination. Understanding transport and dispersion processes in natural fluid flows, from the microscale to the planetary scale, serves as the basis for the development of models aimed at simulations, predictions, and ultimately sustainable environmental management. Within this scope, the subject areas are diverse and may originate from a variety of scientific and engineering disciplines: civil, mechanical and environmental engineering, meteorology, hydrology, hydraulics, limnology, and oceanography.

Impact Factor: 1.605 (2018), Journal Citation Reports®
