Synthetic Organofluorine Chemistry

Series Editors: J. Hu, T. Umemoto

The reference work is the first comprehensive encyclopedia covering various methodologies for the synthesis of organofluorine compounds to date. The contents include both conventional and newly developed synthetic methods, with an emphasis on their applications to the synthesis of useful fluorinated molecules. As such, it provides an authoritative and comprehensive reference guide for all researchers interested in synthetic organofluorine chemistry and its applications.

This encyclopedia series is divided into five individual volumes:

Volume 1. Fluorination

Volume 2. Fluoroalkylation and Related Reactions
and Applications

Volume 3. Building Blocks

Volume 4. Synthesis of Chiral Fluorinated Compounds

Volume 5. Synthetic Applications Utilizing the Unique Properties of Fluorine

The whole series will be published online first, allowing the content to be continuously updated.
