Entomology Monographs

Series Ed.: H. Numata

Insects are the most diverse group of organisms, and many biological advances have been derived from this group. Although entomology is considered to be a classic science, recent developments in molecular methods, application of modern theoretical concepts and collaboration with related sciences have opened new directions in entomology. Japanese scientists play a significant role in these fields, and this book series will focus on such developments. The book series Entomology Monographs publishes refereed volumes on all aspects of entomology, including ecology, ethology, physiology, taxonomy, systematics, morphology, evolutionary developmental biology, genetics, biochemistry, and molecular biology in insects and related arthropods. Authors are not restricted to Japanese entomologists, and other international experts will also be considered on the basis of their recent contribution to these fields.

Recently published:

J. Yukawa, M. Tokuda (Eds.)

Biology of Gall Midges

Evolution, Ecology, and Biological Interactions

M. Sakai (Ed.)

Death-Feigning in Insects

Mechanism and Function of Tonic Immobility

Y. Ishikawa (Ed.)

Insect Sex Pheromone Research and Beyond

From Molecules to Robots

Upcoming Volumes:

T. Sota

Evolutionary Biology of Carabus Ground Beetles

How Species Richness Increases
