# Spatial Information Technology for Sustainable Development Goals

Series: Sustainable Development Goals Series

- Offers an important policy analysis tool for mapping SDGs synergies
- Includes the fundamental concepts to advance techniques for spatial data management and analysis as an integrated manner for resource and infrastructure planning
- Contributes towards Science-Policy Interface by analyzing Sustainable Development Goals (SDG) case studies of different disciplines, such as land use, flood, watershed characterization and infrastructure assessment
- Forges an innovative textbook on SDGs by listing learning objectives as Key Learning Concepts and including questions at the end of each chapter

This textbook aims to develop a scientific knowledge base on spatial information technology to communicate the United Nations' Sustainable Development Goals (SDGs) among students, researchers, professionals and laymen. The book improves understanding of the spatial database and explains how to extract information from this for planning purposes. To enhance the knowledge of geoscientists and environmentalists, the book describes the basic fundamental concepts to advance techniques for spatial data management and analysis and discusses the methodology. The Geographic Information System (GIS), remote sensing and Global Positioning System (GPS) are presented in an integrated manner for the planning of resources and infrastructure. The management of these systems is discussed in a very lucid way to develop the reader's skills. The proper procedure for map making and spatial analysis are included along with case studies to the reader. Where the first part of the book discusses the conceptual background, the second part deals with case studies using these applications in different disciplines. The presented case studies include land use, agriculture, flood, watershed characterization and infrastructure assessment for the Sustainable Development Goals.
