This book explores the complex package of mechanisms used to identify, record, manage and remediate contaminated land, including the system for allocating liabilities that has been set up by China's contaminated land law and accompanying administrative decrees and environmental standards. Statutory control of soil or land contamination is a comparatively new phenomenon for Chinese lawmakers and researchers. After more than ten years of preparation, China recently adopted its first nationwide contaminated land law—the Law of the People's Republic of China on the Prevention and Control of Soil Contamination, which entered into effect in the beginning of 2019. The law deals exclusively with risk management in connection with soil contamination, and the remediation of contaminated land. This book analyzes various facets of how China is managing the risks associated with soil contamination and remediating contaminated sites by means of legislation. Chapters 1 and 2 reveal the current extent of the soil contamination problem in China and the initial policy responses of the country's central government. In turn, Chapters 3 and 4 address the regulatory frameworks and the latest contaminated land legislation at both the local and national level. Lastly, Chapters 5 through 9 offer concrete recommendations, based on lessons learned in the US and UK, for reforming contaminated land management in China.
