The 100 Best Astrophotography Targets

A Monthly Guide for CCD Imaging with Amateur Telescopes

Series: The Patrick Moore Practical Astronomy Series

- Only guidebook available today specifically targeting the best objects for backyard astrophotography
- Organized into monthly chapters so readers can quickly find the best targets for any night of the year
- Helps readers to locate and quickly identify objects that will be both easy to image and provide great visual appeal

Any amateur astronomer who is interested in astrophotography, particularly if just getting started, needs to know what objects are best for imaging in each month of the year. These are not necessarily the same objects that are the most spectacular or intriguing visually. The camera reveals different things and has different requirements. What objects in the sky tonight are large enough, bright enough, and high enough to be photographed? This book reveals, for each month of the year, the choicest celestial treasures within the reach of a commercial CCD camera. Helpful hints and advice on framing, exposures, and filters are included. Each deep sky object is explained in beautiful detail, so that observers will gain a richer understanding of these astronomical objects. This is not a book that dwells on the technology of CCD, Webcam, wet, or other types of astrophotography. Neither is it a book about in-depth computer processing of the images (although this topic is included). Detailed discussions of these topics can be found in other publications. This book focuses on what northern latitude objects to image at any given time of the year to get the most spectacular results.
