Bridging the Semantic Gap in Image and Video Analysis

Series: Intelligent Systems Reference Library

- Presents cutting-edge research on various ways to bridge the semantic gap in image and video analysis
- Explores the correspondence between the low-level information extracted from an image and the meaning that the image holds for the user
- Shows how to transform the representation computed from raw image data to the high-level representation of semantics performed by the image

This book presents cutting-edge research on various ways to bridge the semantic gap in image and video analysis. The respective chapters address different stages of image processing, revealing that the first step is a feature extraction, the second is a segmentation process, the third is object recognition, and the fourth and last involve the semantic interpretation of the image. The semantic gap is a challenging area of research, and describes the difference between low-level features extracted from the image and the high-level semantic meanings that people can derive from the image. The result greatly depends on lower level vision techniques, such as feature selection, segmentation, object recognition, and so on. The use of deep models has freed humans from manually selecting and extracting the set of features. Deep learning does this automatically, developing more abstract features at the successive levels. The book offers a valuable resource for researchers, practitioners, students and professors in Computer Engineering, Computer Science and related fields whose work involves images, video analysis, image interpretation and so on.
