Cardiac Regeneration

Methods and Protocols

Series: Methods in Molecular Biology

- Includes cutting-edge techniques
- Provides step-by-step detail essential for reproducible results
- Contains key implementation advice from the experts

This detailed book addresses major goals of regenerative medicine and the cardiovascular research community with techniques to replenish lost cardiomyocytes, avoid scar-associated pathology, and improve myocardial infarction (MI) outcomes. The collection begins with a section on cardiac injury models, including zebrafish, neonatal and adult mice, and pigs, and continues with sections covering culturing cardiomyocytes from different species as well as methods for labeling or manipulation of cardiac tissue for the purpose of answering questions in regeneration. Written for the highly successful Methods in Molecular Biology series, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Authoritative and practical, Cardiac Regeneration: Methods and Protocols provides the latest models and methods used in the field of heart regeneration, designed for researchers interested in establishing these assays in their laboratories to reproduce or extend findings, and for familiarizing themselves with the field if it is new to them. The chapter "Ventricular Cryoinjury as a Model to Study Heart Regeneration in Zebrafish" is available open access under a Creative Commons Attribution 4.0 International License via link.springer.com.
